## Multi-component Heterocycle Syntheses Based upon Sonogashira Coupling-Isomerization

Gutachter: Prof. Dr. Thomas J. J. Müller
Prof. Dr. Sven Doye

Hiermit erkläre ich an Eides statt, dass ich die vorliegende Arbeit selbständig und ohne unerlaubte Hilfsmittel durchgeführt habe.

Heidelberg, im Mai 2006

## Acknowledgements

First and foremost, I would like to thank my advisor, Prof. Dr. Thomas J. J. Müller, for his excellent guidance, patience and continuous support. Throughout my doctoral work he encouraged me to develop independent thinking and research skills.

I am very grateful to Mrs. Dr. Christa Krämer, Mr. Dr. Alexei Karpov, and Mr. Dr. Alexandru Rotaru for helpful discussions and valuable advices.

I am truly thankful to Mrs. Karin Memminger, Mrs. Nadine Körber, and Mr. Benjamin Willy for their useful suggestions and comments during the preparation of this manuscript.

I extend many thanks to all my colleagues for their support and special working atmosphere.

I also thank to Mrs. Anette Loos and Mrs. Birgit Thaler for their efforts during the research practice.

I am indebted to Mrs. Tanja Coelho, Mrs. Margaret Fischer, Mr. David Haseloff, Mr. Dr. Julien Furrer and Mr. Dr. Schilling for NMR spectra, Mrs. Petra Krämer for UV/Vis and IR spectra, Mrs. Bianka Flock, Mrs. Angelika Seith, Mr. Norbert Nieth, and Mr. Dr. Jürgen Gross for mass spectra, Mrs. Vetter, and Mr. Liebscher for carrying out of elemental analyses, Mr. Dr. Thomas Oeser and Mr. Dr. Romminger for supplying with X-Ray structures.

I am deeply grateful to my parents Florica and Ioan Dediu, and my brother Ionut Dediu who have always encouraged and supported me.

I would like also to thank my husband, Berthold, for being by my side and encouraging me during my Ph.D. work.

Last, but far from least, I would like to thank all my friends for their kind support.

Parts of this thesis have already been published or submitted for publication:

## 1 Summary

The optimization studies of coupling-isomerization reactions (CIR) of electron poor (hetero)aryl halides with propargyl alcohols using microwave heating allowed the synthesis of chalcones in only 8-25 minutes in high yields, using reduced amounts of base (Scheme 1).

Scheme 1 Microwave accelerated CIR of electron withdrawing (hetero)aryl halides with propargyl alcohols.

Moreover the microwave-assisted coupling-isomerization reaction (MACIR) was successfully extended to electron rich aryl halides that commonly did not undergo CIR when conventional literature conditions were used (Scheme 2).

Scheme 2 Microwave assisted CIR of electron donating aryl halides with propargyl alcohols.

These transformations required the use of stronger bases like DBU ( $\mathrm{p} K_{B} \sim 1.1$ ). However, only 2 equivalents were sufficient for the completion of CIR for a large variety of substrates.

The versatility of 1,3-di(hetero)aryl enones as 3-carbon building blocks was exploited in one-pot polysubstituted pyridine $\mathbf{1 0}$ synthesis starting from readily available aryl halides $\mathbf{1}$ and propargyl alcohols 2, using a CIR-enamine addition-cyclocondensation sequence (Scheme 3).

Scheme 3 One-pot four-component synthesis of pyridine derivatives $\mathbf{1 0}$.

The mechanism of the enamine addition to chalcone is supported by the isolation of the Diels-Alder cycloadduct 6. The formation of the intermediate $\mathbf{6}$ was in agreement with molecular modeling studies.

Following the same CIR-enamine addition-cyclocondensation sequence and using appropriate enaminones 11, different dihydropyridines $\mathbf{1 2}$ and pyridine derivatives $\mathbf{1 3}$ could be synthesized in moderate yields (Scheme 4).

Scheme 4 One-pot three-component synthesis of dihydropyridines $\mathbf{1 2}$ and pyridines $\mathbf{1 3}$.

Similar to chalcones, the 1,3-di(hetero)aryl enimines were used as key intermediates in one-pot pyridine derivatives synthesis, in this case as 2-carbon-1-nitrogen synthons. The enimines underwent inverse Diels-Alder reactions with electron demand when reacted with electron rich ketene diethyl acetal or with even more electron rich $N, S$ cyclic ketene acetals (Scheme 5).

Scheme 5 One-pot three-component synthesis of pyridines 21 and 27.

Whereas multicomponent syntheses with $\beta$-enamino crotonates under conductive heating led to the formation of pyridines and dihydropyridines in low to moderate yields, by a CIR-enamine addition-cyclocondensation sequence, the microwave assisted multicomponent
syntheses gave rise to the unexpected formation of cyclohexadienes $\mathbf{3 1}$ or cyclohexenones 32, in good yields. These products can be interpreted as the results of a MACIR-enamine addition-aldol condensation sequence (Scheme 6).

Scheme 6 One-pot MW-assisted multicomponent synthesis of cyclohexadienes $\mathbf{3 1}$ and cycohexanones 32.

A direct application of MACIR allowed the one-pot synthesis of quinoline derivatives 41, in good to excellent yields ( $40-92 \%$ ). Based upon this methodology, naturally occuring chimanine alkaloids were synthesized starting from the readily available $o$-amino aryl halides $\mathbf{1}$ and propargyl alcohols 2, in 30 minutes (Scheme 7).

Scheme 7 One-pot microwave-assisted quinoline $\mathbf{4 1}$ synthesis.

## 2 Zusammenfassung

Die Studien zur Optimierung der Kupplung-I_somerisierungs-Reaktion (KIR) von elektronenarmen (Hetero)Arylhalogeniden 1 mit Propargylalkoholen 2 unter Mikrowellenbestrahlung führten zu Chalkonsynthesen mit sehr kurzen Reaktionszeiten. Zudem konnte der Verbrauch an Base reduziert werden (Schema 1).

Schema 1 MUKIR von elektronenarmen Arylhalogeniden mit Propargylalkoholen zu Chalkonen 4.

Des weiteren konnte die mikrowellenunterstützte Kupplung-İsomerisierungsReaktion (MUKIR) bei leicht abgewandelten Reaktionsbedingungen erfolgreich auf elektronenreiche Arylhalogenide ausgeweitet werden.

Schema 2 MUKIR von elektronereichen Arylhalogeniden mit Propargylalkoholen zu Chalkonen 4.

Bei diesen Transformationen kamen stärkere Basen wie zum Beispiel DBU zum Einsatz. Hierdurch konnte aber auch die für die Reaktion benötigte Basenmenge in den meisten Fällen auf zwei Äquivalente abgesenkt werden.

1,3-Di(hetero)arylenonen sind als C3-Bausteine für Ein-Topf-Reaktion zur Darstellung von Pyridinen 10 ausgezeichnet geeignet. Ausgangsverbindungen stellten wiederum die verfügbaren Arylhalogenide $\mathbf{1}$ und die Propargylalkohole 2 dar (Schema 3).

Schema 3 Ein-Topf-Vier-Komponenten-Synthese von Pyridinen 10.

Aufgrund der Isolierung des Diels-Alder-Cycloadduktes 6 konnte der mechanistische Verlauf der Enaminaddition gestützt werden. Die Bildung dieses Intermediates stimmt mit den berechneten Strukturvorhersagen überein. Bei Nutzung geeigneter Enaminone 11 konnten unter Befolgung der gleichen Reaktionswege verschiedene Dihydropyridine 12 und Pyridinderivative 13 synthetisiert werden (Schema 4).

## Schema 4 Ein-Topf-Drei-Komponenten-Synthese von Dihydropyridinen 12 und

 Pyridinen 13.Analog den Chalkonen 4 wurden die 1,3-Di(hetero)arylenimine 19 als Schlüsselintermediate - in diesem Fall als C2N-Synthone - für eine Ein-Topf-Pyridinsynthese genutzt. Die Enimine 19 durchlaufen bei der Reaktion mit elektronenreichen Ketendiethylacetalen 20 oder noch nucleophileren cyclischen $N, S$-Ketenacetalen 25 Diels-Alder Reaktionen mit inversem Elektronenbedarf (Schema 5).

21
25-65\%

Schema 5 Ein-Topf-Drei-Komponenten-Synthese der Pyridine 21 and 27.

Während bei konventionellem Erhitzen die Multikomponentensynthese mit $\beta$ Enaminocrotonaten 30 zur Bildung von Pyridinen und Dihydropyridinen in niedrigen oder moderaten Ausbeute führt, kommt es beim Erhitzen durch Mikrowellen zur unerwarteten Bildung von Cyclohexadienen 31 oder Cyclohexenonen 32 mit guten Ausbeuten. Diese

Produkte können als Ergebnis einer MUKIR-Enamin-Additions-Aldolkondensations-Sequenz interpretiert werden (Schema 6).

Schema 6: Mikrowellenunterstützte Mehrkomponentensynthese von Cyclohexadienen 31 und Cycohexanonen 32.

Einen direkten Anwendungsbezug der MACIR ermöglicht die Ein-Topf-Synthese von Chinolinderivaten 41 anhand der Reaktion von o-Aminoarylhalogeniden 1 mit Propargylalkoholen 2. Basierend auf dieser Methode wurden die in der Natur vorkommenden Chimanine Alkaloiden in guten bis exzellenten Ausbeuten dargestellt (Schema 7).

Schema 7 Mikrowellenunterstützte Ein-Topf-Chinolinsynthese.

## 3 Introduction

One-pot multicomponent processes address very fundamental principles of synthetic efficiency and reaction design, and therefore have gained a considerable and steadily increasing academic, economic, and ecological interest. ${ }^{1,2}$ They are diversity oriented syntheses $^{3}$ that can be often developed into combinatorial and solid-phase strategies, ${ }^{2 d, 4}$ promising manifold opportunities for generating novel structures of pharmaceuticals, catalysts, and even novel molecule based materials.

The combination of one-pot multicomponent reactions and microwave irradiation might be one of the most straightforward steps in the development of multicomponent processes since the microwave heating is able to speed up reactions, reduce side reactions, increase yields and improve reproducibility. For instance, the formation of heterocycles, well-known constituents of many natural and biologically active compounds, by cyclocondensation reactions is typically a well-suited process for microwave acceleration. Many of these condensation reactions require high temperatures and conventional reaction conditions very often involve heating the reactants in an oil or sand bath for many hours or even days.

Similarly, the rate of the transition metal-catalyzed carbon-carbon and carbonheteroatom bond-forming reactions that typically need hours or days to reach completion with conventional conductive heating under reflux conditions, can be enhanced significantly by employing microwave heating under sealed vessel conditions. The use of metal catalysts in conjunction with microwaves may have great advantages since the inverted temperature gradients under microwave conditions may lead to an increased lifetime of the catalyst and the elimination of wall effects.

Numerous reports on microwave-assisted transition metal-catalyzed reactions and onepot multicomponent reactions have been published, therefore, only a few recent examples were selected for detailed description.

Liu et al. ${ }^{5}$ reported a microwave-assisted one-pot total synthesis of several quinazolinone alkaloids as deoxyvasicinone, mackinazolinone, isaindigotone and their derivatives that exhibit anti-inflammatory, antimicrobial and antidepressant activities (Scheme 8).

Scheme 8 One-pot total synthesis of quinazolinone alkaloids promoted by microwave irradiation.

A plausible mechanism for the formation of the quinazolinone core involves a transannular cyclization of the intermediate cyclic diamide (Scheme 9). The cyclic diamide may be prepared via ring expansion of the intermediate benzoxazinone, which could be accessed in situ from boc-protected benzoxazinone, which in turn should be generated in situ from the readily available anthranilic acid and boc-protected amino acids. In addition, the isaindigotone could be synthesized through a condensation reaction of quinazolinone with the appropriate aldehyde via a three-component one-pot reaction process.

Scheme 9 Mechanistic rationale of the quinazolinone derivatives synthesis.

Microwave synthesis has been frequently criticized because of the typically high reaction temperatures that invariably would lead to reduced selectivities. This is perhaps the reason why comparatively few enantioselective processes driven by microwave heating have been reported in the literature. In 2000 the research groups of Moberg, Hallberg, and Larhed reported on microwave-mediated palladium- ${ }^{6}$ and molybdenum-catalyzed ${ }^{7}$ asymmetric allylic alkylation reactions involving neutral carbon, nitrogen, and oxygen nucleophiles. Both processes were carried out under non-inert conditions and yielded the desired products in high chemical yield and with typical ee values of over $98 \%$.

More recently, Trost and Andersen have applied this concept in their approach to the orally bioavailable HIV inhibitor tipranavir ${ }^{8}$ (Scheme 10). Synthesis of the key chiral intermediate was achieved by asymmetric allylic alkylation starting from a carbonate derivative. A $94 \%$ yield of the product was achieved by employing $10 \mathrm{~mol} \%$ of the molybdenum precatalyst and $15 \mathrm{~mol} \%$ of a chiral ligand with 2.0 equivalents of sodium dimethylmalonate as the additive. The reaction was carried out by sealed-vessel microwave heating at $180^{\circ} \mathrm{C}$ for 20 minutes. Thermal heating under reflux conditions $\left(67^{\circ} \mathrm{C}\right)$ required 24 h and produced the same chemical yield of the key intermediate, though higher enantiomeric purity ( $96 \% e e$ ) could be reached

Scheme 10 MW-assisted molybdenum-catalyzed asymmetric allylic alkylation in the total synthesis of the HIV inhibitor tipranavir.

Thus, the microwave irradiation has proven its significant benefit and general applicability in organic synthesis.

A challenging and unexplored concept that combines synergetically the advantages of the metal-catalyzed reactions with multicomponent process and microwave technique can be envisioned. Thus, the implementation of the Sonogashira coupling-isomerization as a mild and efficient route to chalcones or enimines into microwave-assisted multicomponent methodologies for the synthesis of biologically active heterocycles and new scaffolds represents an interesting and challenging goal. (Scheme 11).

Scheme 11 General concept.

Therefore, the goals of this thesis were:

1) The optimization of the reaction parameters for an efficient, rapid and general coupling-isomerization reaction of electron poor as well as electron rich (hetero)aryl halides with propargyl alcohols,
2) To perform coupling-isomerization reactions of aryl halides with propargyl alcohols or propargyl amines and transform the intermediate chalcones or enimines directly without isolation in a one-pot fashion into biologically active pyridines, tetrahydroquinolines, naphthyridines, quinolines,
3) To investigate the microwave effects on multicomponent synthesis versus conventional heated multicomponent synthesis, and
4) To extend this general coupling-isomerization reaction to the synthesis of selected natural products.

## 4 General Part-Results and Discussion

### 4.1 Chalcones - Natural and Synthetic Compounds, Versatile Synthons for Cycloaddition Reactions

### 4.1.1 Chalcones - Literature Review

Flavonoids, a group of $\sim 5000$ naturally occurring compounds, have long been known to function as defence compounds in protecting the seeds and the roots of plants from insects, bacteria, fungi and alien plants. ${ }^{9}$ 1,3-diaryl-2-propen-1-ones, constitute a class of naturally occurring and synthetic compounds belonging to the flavonoid family. They are often referred as "chalcones", the term being first coined by Kostanecki ${ }^{10}$ who did pioneering work in the synthesis of natural colouring compounds.

Chalcones possess a broad spectrum of biological activity. Not many structural templates can claim association with such a diverse range of pharmacological activities, among which cyctotoxicity, ${ }^{11}$ antitumour, ${ }^{12}$ anti-inflammatory, ${ }^{13}$ antiplasmodial, ${ }^{14}$ antioxidant ${ }^{15}$ properties are widely cited. Dimmock and coworkers gave an insightful review of the biological properties of chalcones in 1999. ${ }^{16}$

Two naturally occurring chalcones, Isoliquiritigenin and Licochalcone A (Fig. 1) extracted from licorice plant (glycyrrhiza glabra), one of the oldest known botanicals in Chinese medicine, may account for many of its beneficial activities (anti-inflammation, antiulcer, antiallergy, and anticarcinogenesis). ${ }^{17}$

isoliquiritigenin

licochalcone $A$
$\mathrm{IC}_{50}($ Leish. $)=4.0 \mu \mathrm{M}$
$\mathrm{IC}_{50}($ Tuberc. $)=5-10 \mu \mathrm{M}$

Fig. 1 Naturally occurring chalcones extracted from Chinese licorice.

Additionally, Zhai et al. ${ }^{18}$ have found that Licochalcone A alters the ultrastructure of the parasite mitochondria and inhibits their function, having a strong antileishmanial activity. Similarly to Licochalcone A, other synthetic oxygenated chalcones exhibit a strong antileishmanial activity both in vitro and in vivo (Fig. 2).

$\mathrm{IC}_{50}($ Leish. $)=4.0 \mu \mathrm{M}$

$\mathrm{IC}_{50}($ Leish. $)=5.8 \mu \mathrm{M}$

$\mathrm{IC}_{50}($ Leish. $)=5.7 \mu \mathrm{M}$

$$
\mathrm{IC}_{50}(\text { Leish. })=4.5 \mu \mathrm{M}
$$

Fig. 2 Synthetic oxygenated chalcones with antileishmanial activity.

Leishmaniasis is a major and increasing health problem, particularly in Africa, Asia and Latin America. In Europe, the disease is endemic in many southern countries, and imported leishmaniasis is a growing problem, and the emergence of AIDS-related leishmaniasis has added a new dimension to the problem.

Recently, Simoneau et al. ${ }^{19}$ have identified the flavokawains (Fig. 3), from kawa extracts that have been commonly used by South Pacific Islanders for thousands of years, as anticarcinogen agents and apoptosis inducers.

flavokawain A

flavokawain B

flavokawain C

Fig. 3 Flavokains, naturally occurring chalcones extracted from Kawa.

Apoptosis is considered as a physiological process to extinguish DNA-damaged cells with minimal damage to surrounding normal cells or tissue. Novel apoptosis inducers, therefore, would provide more effective therapy and prevention against cancer.

Comprehensive accounts of the effects of structure on activity are given by Liu and Dhar. ${ }^{11,12}$ Generally, due to the $\alpha, \beta$-unsaturated ketone moiety, chalcones have a preferential reactivity toward soft nucleophiles as thiols, rather than hard nucleophiles like amino and hydroxy groups ${ }^{19}$ (Scheme 12). Therefore, chalcones are less likely to interact with nucleic acids and then avoid the problems of mutagenicity and carcinogenity associated with certain alkylating agents in cancer chemotherapy. ${ }^{16}$ In addition, chalcones which are typical Michael acceptors, can bind to particular receptors and lead to the induction of phase II enzymes against carcinogens. ${ }^{20}$

Scheme 12 Reaction of a representative chalcone (Michael acceptor) and a nucleophilic thiol (RSH).

For antimitotic activity, the presence of methoxy substituents, $\alpha$-methylation of enone moiety and the presence of $2^{\prime}$ oxygenated substituents are favourable features. Conformational restraint of the chalcone template generally leads to a decrease in cytotoxic activity. Chemoprotection by chalcones may be a consequence of their antioxidant properties, mediated via inhibition or induction of metabolic enzymes, by anti-invasive effect or a reduction in nitric oxide production. Hydroxy and prenyl substituents are generally associated with antioxidant properties. ${ }^{21}$

### 4.1.2 Chalcone Synthesis - Literature Review

Chalcones are the first isolable compounds of the flavonoid biosynthesis in plants, but do not necessarily accumulate to any appreciable degree unless the enzyme chalcone isomerase, which catalyses the cyclization of chalcone to flavone, is absent. ${ }^{22}$ Chalcones are readily synthesized in the laboratory and in the literature there are numerous references to structural modifications of the chalcone template. Some examples are introducing different substituents on the phenyl rings A and B, (Fig. 4) replacing the phenyl rings with heterocyclic and polyaromatic rings, and cyclization of the chalcone gives rise to the formation of conformationally restricted analogues.

Fig. 4 Substituting sites on chalcone template.

Most synthetic methods are based on the base-catalysed Claisen-Schmidt condensation of aldehydes and appropriate acetophenones in polar solvents (Scheme 13).

Scheme 13 Synthesis of chalcones by base-catalyzed Claisen-Schmidt condensation of ketones and aldehydes.

The method is versatile and convenient, although yields may be variable, ranging from 5 $\%$ to $90 \%$. Many investigators have sought to improve yields using alternative catalysts, other than the widely employed alkaline bases like NaOH and KOH . Among different catalysts used were sodium phosphate doped with sodium nitrate ${ }^{23}$ and hydrated aluminiummagnesium hydroxides. ${ }^{24}$

In an effort to encourage "green chemistry", some solvent-free Claisen-Schmidt methods have been developed. Fringuelli et al. used a polymer-supported TBD (1,5,7-triazabicyclo[4.4.0]dec-5-ene) catalyst, obtaining good results, although the same reactions performed under solvent-free conditions by using non-supported base (TBD) gave closely comparable results both in terms of the reaction time and isolated yields. ${ }^{25}$

Ultrasound and microwave-assisted methods reduced reaction times and facilitated work-up for the synthesis of chalcones. ${ }^{26}$ Claisen-Schmidt condensation in the presence of pulverised KOH or KF supported alumina, under ultrasound gave good yields under milder conditions and at shorter reaction times. ${ }^{27}$

The utility of microwave-assisted synthesis was investigated for 2'-hydroxy chalcones that are generally impeded by cyclization to flavonones. Unfortunately, protecting the 2 , hydroxy group for minimising the cyclization reaction is not a viable option due to the ortho position of the group. Stoyanov and coworkers ${ }^{28}$ noted that microwave irradiation of the reactants in $20 \% \mathrm{KOH} /$ ethanol in a closed pressure vial gave excellent yields of 2'-hydroxy chalcones with no trace of side products. When the reaction was repeated in an oil bath at the same temperature ( $\sim 130{ }^{\circ} \mathrm{C}$ ) identical yields were obtained. Thus, a high temperature and short heating time are important conditions for ensuring good yields of $2^{\prime}$-hydroxy chalcones.

Despite its versatility and generality, the aldol condensation is not a suitable method for multistep-synthesis due to the required drastic conditions such as strong alkaline base, or strong Lewis acids that are not compatible with further transformations of chalcones.

New methodologies for synthesis of chalcones have also been described in the literature. A general method, based on the Suzuki reaction, between benzoyl chloride and styrylboronic acid gave chalcones in nearly quantitative yields ${ }^{29}$ (Scheme 14). This reaction is not affected by substituents (electron-donating, electron withdrawing) on the acid chloride or styrylboronic acid.

Scheme 14 Chalcone synthesis by Suzuki coupling between activated benzoic acids and styrylboronic acids.

On the other hand, coupling cinnamoyl chloride and phenylboronic acid in presence of palladium catalyst gave a complex mixture of products.

Xu et al $\mathrm{al}^{30}$ have examined the acid-catalysed coupling reaction of aromatic alkynes with aldehydes in ionic liquids (Scheme 15). They found out that aromatic aldehydes with electron-donating and electron-withdrawing groups including those bearing an alkoxy, chloro, bromo or nitro substituents were able to undergo the corresponding coupling reaction and displayed high conversion to chalcones, although with aliphatic alkynes, as starting material, no reaction occurred even after prolonged reaction times.

Scheme 15 Chalcone synthesis via ionic-liquid-promoted coupling of alkynes with aldehydes.

### 4.1.3 Reactions of Chalcones

The $\alpha, \beta$-unsaturated ketone moiety is an extremely common feature of many organic compounds. As such, it serves as a very useful site for syntheses and transformations. Numerous reactions have been extensively developed over the years: e.g., Michael additions; $\beta$-cuprate additions; $\alpha$-alkylations or arylations by reductive trapping or oxidative couplings; carbonyl refunctionalizations by addition, oxidation, reduction, and alkylidenations and $\alpha$ oxidations by halogen-dehalogenation (Scheme 16).

Scheme 16 Chalcone transformation reactions.

Besides the refunctionalization reactions of the "ene" and "one" functionalities, chalcones have proven to be useful synthons for the preparation of various heterocycles such as, pyridine, ${ }^{31}$ pyrimidine, ${ }^{32}$ furans, ${ }^{33 \mathrm{~d}}$ pyrroles, pyrazolines, ${ }^{34}$ spiroadducts, ${ }^{35} \alpha$-tetralones, ${ }^{36}$ pyrindines, tetrahydroquinolines ${ }^{33 f}$ and heterazepines, ${ }^{33 b, c}$ (Scheme 17). Furthermore, the chalcones potency as building blocks was successfully exploited in various one-pot multicomponent heterocycle syntheses. ${ }^{33}$

Scheme 17 Heterocycle syntheses using chalcone as building block.

Since chalcones possess two electrophilic centers, the reactions with nucleophiles (Michael addition) and binucleophiles (cyclocondensation) are the most important transformations for heterocycle synthesis (Scheme 18).

Scheme 18 The electrophilic centers of chalcone.

Although not so numerous, some transformations involving the nucleophilic center of chalcone have also been reported, such as tandem Michael addition-Robbinson reactions with the formation carbocyclic rings. ${ }^{37}$

### 4.1.4 Synthesis of Chalcones via Sonogashira Coupling-Isomerization Reaction

Transition metal mediated croos-couplings have proven to be powerful reactions for mild, highly efficient carbon-carbon bond formations. Among these processes, the bimetallic, catalytic Sonogashira coupling has turned out to be a versatile and mild alkyne-to-alkyne transformation, i.e. a powerful tool for transforming a terminal alkyne into an internal one as a consequence of a sp-sp ${ }^{2}$-CC-bond forming reaction. ${ }^{38}$ Besides mild reaction conditions, an excellent compatibility with fragile functional groups dispenses with tedious protectiondeprotection operations, and since hydrogen halide (scavenged by weak bases such as amines) is formed as the sole by-product, the Sonogashira coupling displays a high degree of atom economy.

Our group has recently discovered and developed an unusual mode of alkyne activation by a detouring outcome of the Sonogashira coupling, i.e. a coupling-isomerization reaction. ${ }^{39}$

Scheme 19 The coupling-isomerization-reaction as a peculiar mode of alkyne activation by cross-coupling.

Conceptually, the cross-coupling reaction of an electron deficient halide with a terminal alkyne not only activates the newly formed internal triple bond towards Michael-type additions but also at the propargyl position, e.g. towards an alkyne-allene isomerization (Scheme 19).

In particular, the Sonogashira coupling of electron poor halides with 1-(hetero)aryl propargyl alcohols furnishes chalcones in good to excellent yields (Scheme 20).

Scheme 20 Chalcones synthesized by CIR.

The mild conditions of CIR allow to apply chalcones as in-situ generated Michael acceptors in multicomponent syntheses of a large variety of heterocycles in one-pot fashion (Scheme 17). Besides exploiting the Michael reactivity for the multicomponent reactions (MCR) heterocyclizations, the synergism between palladium-copper catalyst system and the generated electron-deficiency at the $\alpha$-(hetero)aryl substituent became the key to conceive and further devise sequential Pd-catalyzed reactions such as additional Sonogashira, Heck, Suzuki, or coupling isomerization ${ }^{40}$ (Scheme 21).

Scheme 21 Exploiting gradual reactivity differences for coupling-isomerization sequence.

Although the Sonogashira coupling-isomerization has found many applications, CIR lacks generality. The substitution pattern of $\pi$-system halide is limited to electron deficient halides and aromatic propargylic alcohols are generally preferred over the alkyl-propargylic alcohols. Another drawback of CIR is the required large excess of base, both for the coupling and for the isomerization step (Scheme 22).

Scheme 22 Mechanistic rationale of CIR.

The large excess of base does not necessarily favours the compability of CIR with the multistep methodologies, especially in the case of the acid catalyzed subsequent steps. Trying to overcome these main drawbacks a new microwave-assisted CIR was conceived.

### 4.1.5 Microwave Assisted Coupling-Isomerization Reaction (MACIR) - Towards a General CIR

### 4.1.5.1 Literature Overview on Microwave Acceleration of Transition Metal Catalysis

The number of publications on microwave assisted organic synthesis has been increasing exponentially since the first report on the use of microwave heating to accelerate organic chemical transformations by the groups of Gedye, Giguere and Majetich in 1986. ${ }^{41}$ Microwave heating is not only able to reduce reaction times from hours to minutes, but it is also known to reduce side reactions, increase yields, and improve reproducibility. Therefore, many academic and industrial research groups are already using microwave as a forefront technology. Also a large number of review articles ${ }^{42}$ and several monographs ${ }^{43}$ provide an extensive coverage of the subject.

Homogenous transition metal-catalyzed reactions have attracted considerable interest in microwave assisted organic synthesis, representing one of the most important and best studied reaction types in this field. ${ }^{44}$ Transition metal catalyzed carbon-carbon and carbon-heteroatom bond-forming reactions typically need hours or days to reach completion by conventional heating under reflux conditions.

The use of metal catalysis in conjunction with dielectric microwave heating may have significant advantages over traditional conductive heating methods, since the inverted temperature gradients under microwave conditions may lead to an increased lifetime of the catalyst through elimination of wall effects ${ }^{45}$ (Fig. 5), together with a controlled heating at "molecular level" ${ }^{46}$ The microwave irradiation raises the temperature of the whole reaction volume simultaneously (bulk heating) whereas in the oil-heated tube, the reaction mixture in contact with the vessel wall is heated first.

Fig. 5 Inverted temperature gradients in microwave versus oil-bath heating: difference in the temperature profiles (finite element modelling) after 1 min of microwave irradiation (left) and treatment in oil bath (right).

Sonogashira reaction enjoys remarkable popularity as a reliable and general method for the preparation of unsymmetrical alkynes. Numerous elegant synthetic transformations based on C-C bond forming Sonogashira reactions have been developed both in classical organic synthesis and natural product chemistry. ${ }^{47}$ General protocols for microwave-assisted Sonogashira reactions under controlled conditions were first reported in 2001 by Erdelyi and Gogoll. ${ }^{48}$ Typical reaction conditions for the coupling of aryl iodides, bromides, chlorides and triflates involve DMF as solvent, diethyl amine as the base in large excess, $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(2-5$ $\mathrm{mol} \%)$ and $\mathrm{CuI}(5 \mathrm{~mol} \%)$ as catalysts.

Although there are many reports on MW-assisted Sonogashira reaction in the literature, MW-assisted Sonogashira coupling-isomerization reaction (MACIR) (Scheme 23) has not been reported to date.

Scheme 23 Sonogashira coupling-isomerization reaction.

### 4.1.5.2 The General MACIR

Attempts to optimize Sonogashira coupling-isomerization under microwave irradiation would have to address some of CIR limitations observed under conventional heating conditions:

- the limited choice of the reaction medium,
- large excess of base,
- long reaction times, 16-24 h,
- the demand for a reactive arene derivative.

First optimisation studies of Sonogashira coupling-isomerization under microwave irradiation were focused on reducing the reaction time (under conventional condition, reaction times are over 16 h ) and the amount of base in order to enhance the enones reactivity as dienes, i.e. under Lewis acid catalyzed Diels-Alder reaction conditions. Therefore, different electron poor aryl-halides $\mathbf{1}$ and propargyl alcohols $\mathbf{2}$ were subjected to CIR (Scheme 24) screening various parameters such as, base, temperature, reaction time, concentration of the substrate and solvent.

Scheme 24 MACIR of (hetero)aryl halides 1 with propargylic alcohols 2.

The amount of base was varied between $1.05-10$ eq., the optimum being achieved for 5 equivalents of $\mathrm{NEt}_{3}$ and THF as a solvent, with a conversion of $100 \%$ and $84 \%$ yield of the desired chalcone 4a (entry 15, Table 1). Obviously, acetonitrile and dimethylformamide are not suitable solvents for CIR. Side-reactions such as Michael additions, Diels-Alder reactions may occur, and consequently the yields are lower, i.e. $67 \%$ using acetonitrile (entry 10), and $73 \%$ for dimethylformamide (entry 12, Table 1).

Table 1 Optimization MACIR experiments for the reaction of $\mathbf{1 a}\left(\mathrm{R}^{1}=p-\mathrm{NCC}_{6} \mathrm{H}_{4}-\right)$ and $\mathbf{2 a}$ $\left(\mathrm{R}^{2}=\mathrm{Ph}\right)$ using $\mathrm{NEt}_{3}$ as a base.

Within the optimization scope, the reaction temperature was varied between 100 and $180{ }^{\circ} \mathrm{C}$, with an optimal reaction enhancement at $150{ }^{\circ} \mathrm{C}$. At higher temperatures fast decomposition of the palladium catalyst together with the product decomposition were observed (entry 11).

Using triphenylphosphane as additive, the yields of the desired chalcones were improved by over $10 \%$, entry 4 and 9 (Table 2 ). The role of this additive is not well established. It might increase the catalyst's solubility or the catalyst's stability at higher temperatures ${ }^{49}$ and it also facilitates the reduction of $\mathrm{Pd}^{2+}$ to $\mathrm{Pd}^{0}$.

Table 2 Optimization MACIR experiments for the reaction of $\mathbf{1 a}\left(\mathrm{R}^{1}=p-\mathrm{NCC}_{6} \mathrm{H}_{4}\right)$ and $\mathbf{2 a}$ $\left(\mathrm{R}^{2}=\mathrm{Ph}\right)$ using $\mathrm{PPh}_{3}$ as additive.

The reaction time was varied between 5 to 100 minutes. Surprisingly, the reaction showed full completion after 5 min using DMF as solvent, 0.2 eq of $\mathrm{PPh}_{3}$ and 5 eq of $\mathrm{NEt}_{3}$, yield $87 \%$ (entry 9). Longer reaction times did not improve the yields (entries 6-8), and they might lead to side reactions together with product decomposition.

Using THF as solvent, the yield of the desired chalcone was almost quantitative, but the reaction needed longer time, 15 minutes (entry 4). Similarly, longer reaction times did not
improve the yields. Optimal concersion was achieved after 15 min , whereas prolonging the reaction time to 20-35 min the yield significantly decreased (Fig. 6).

Fig. 6 Reaction time - yield dependence for MACIR using THF as solvent

Reaction rates strongly depend on the substrate concentrations. Optimal rates were found for 0.25 M . At higher concentrations, the probability of explosions increases as Pd and Cu catalysts are very strong microwave absorbers and higher concentration of the catalysts might be critical.

The optimal results were found for 5 eq of triethylamine, less amounts of base gave lower yields of the chalcone $\mathbf{4 a}$ (entry 14, Table 1 and entry 5, Table 2). In order to decrease the amount of base, alternative stronger bases, for instance DBU ( $\mathrm{p} K_{\mathrm{b}} \sim 1.1$ ), were tested. The chalcone $\mathbf{4 a}$ ( $85 \%$ ) was obtained in 5 minutes using only 1.05 eq of DBU, entry 1 (Table 3). Neither longer reaction time, entry 2 , nor higher temperature, entry 4 (Table 3 ) improved the product formation.

Table 3 Optimization MACIR experiments for the reaction of $\mathbf{1 a}\left(\mathrm{R}^{1}=p-\mathrm{NCC}_{6} \mathrm{H}_{4}\right)$ and $\mathbf{2 a}$ $\left(\mathrm{R}^{2}=\mathrm{Ph}\right)$ using DBU as base, in presence of $\mathrm{PPh}_{3}$, in THF.

For the chalcone formation high temperatures and short reaction times are generally more favourable. Good to excellent yields (57-96 \%) were obtained in 8-30 minutes (Table 8). Various substituents, such as sulfonamide, 2 or 3-thienyl substituents, well-known motifs in pharmacophor molecules, were inserted into the chalcone template (entries 8-10, Table 8).

Aryl acetylenes are generally more reactive than alkyl acetylenes, due to the increasing acidity of the acetylenic hydrogen. ${ }^{48}$ In order to increase the MACIR rate for the alkyl propargyl alcohols, aryl iodides were used instead of corresponding less reactive aryl bromides. However, MACIR using 1-hexyn-3-ol (2d) and p-iodobenzonitrile (1h) furnished the corresponding chalcone $\mathbf{4} \mathbf{j}$ in a moderate yield, $62 \%$ (entry 11). In the case of 1-butyn-3ol (2e) available as 0.5 M aqueous solution, the only isolated product was the unisomerized alkyne $\mathbf{3 k}$ (entry 13). The exclusive formation of $\mathbf{3 k}$ might be explained by the higher stability of the alcohol in an aqueous solution.

## Table 8 continued

(

The remarkably short reaction times for microwave-assisted CIR achieved through these optimization studies raised the question of whether the reaction might have been affected by any kind of special rate enhancing microwave effect. Such non-thermal effects were discussed for a long time in the literature. ${ }^{50}$ Therefore, the coupling-isomerization reactions were carried out at exactly similar conditions using both conventional conductive and dielectric heating. The chosen model was the CIR of $p$-bromobenzonitrile (1a) with 1-phenylprop-2-yn-1-ol (2a), which furnished excellent results under microwave irradiation, entry 1 (Table 8). As expected, the conventional CIR (method B, Scheme 25) furnished lower yields of the desired chalcone, with over $30 \%$. The significant difference of the isolated yields can be reduced to the entirely thermal microwave effect ${ }^{51}$ as a consequence of more efficient heating, so called "molecular heating".

Scheme 25 Evidence experiments for MW effects.

In order to scout the scope and the generality of MACIR procedure, also electron rich aryl halides, substrates that commonly do not participate in the CIR fashion were examined. All reports on CIR sustained the necessity for strong acceptor halides, the main limiting condition for the propargyl alcohol-enone isomerization. Thus CIR of electron neutral aryl halides stopped after Sonogashira coupling without further isomerization (Scheme 26).

Scheme 26 CIR Experiments of an electron neutral aryl halide.

As the isomerization is a base-catalyzed process, different type of bases of various $\mathrm{pK}_{\mathrm{b}}$ were tested (Table 9) to find out the optimal conditions for the CIR of electron rich aryl halides. The MACIR of iodobenzene 1i and 1-phenylprop-2-yn-1-ol 2a (Scheme 27) was chosen as model reaction.

Scheme 27 MACIR experiments of iodobenzene $\mathbf{1 i}$ with 1-phenylprop-2-yn-1-ol 2a.

Using triethylamine ( $\mathrm{p} K_{b} \sim 3.35$ ) the isolated yields were poor both for the coupling product 31 and the coupling-isomerization product $\mathbf{4 I}$ (entry 1 and 2). In case of piperidine ( $\mathrm{p} K_{b} \sim 3.2$ ), a slightly stronger base than triethylamine, the coupling product $\mathbf{3 1}$ is formed at
$100{ }^{\circ} \mathrm{C}$ in higher yields ( $80 \%$, entry 3). At higher temperature, the chalcone can undergo either a conjugate addition or a Mannich reaction and consequently only $9 \%$ of the coupling product $\mathbf{3 l}$ and $0 \%$ of the chalcone $\mathbf{4 l}$ were obtained, entry 4 (Table 9). Using only 1.05 eq . DBU, as much stronger organic base ( $\mathrm{p} K_{b} \sim 1.1$ ), the reaction furnished $70 \%$ of 31 and $8 \%$ of chalcone 41 (entry 5). This promising result encouraged me to investigate the CIR using higher amount of DBU. As expected, higher yields were obtained using 2 eq. of DBU, the coupling product was completely isomerized to the corresponding chalcone $\mathbf{4 1}(30 \mathrm{~min}$, at $100^{\circ} \mathrm{C}, 92 \%$, entry 6 ). For the same parameters, but under conventional heating condition, the reaction furnished only $71 \%$ of chalcone $\mathbf{4 l}$ (entry 7). The large difference of the isolated yields, over $20 \%$, can be accounted for microwave effects, since all other parameters had the same values in both cases.

The conditions for the productive CIR of $p$-iodobenzene under microwave irradiation were applied to further substrates. The electron rich $p$-iodotoluene and the even more electron rich $p$-iodoanisol and 3-iodoaniline were successfully subjected to MACIR, although to complete the isomerization, slightly higher temperatures were needed, $120^{\circ} \mathrm{C}$ (entries $2,5,8$, Table 10).

In summary, a new, general, rapid and efficient microwave-assisted Sonogashira coupling-isomerization reaction (MACIR) was developed. It was applied to the coupling of various electron poor and electron rich (hetero)aryl halides, with propargyl-aryl(alkyl) alcohols using a reduced amount of base (1.05-5 eq). Good to excellent yields (52-96 \%) were obtained within a few minutes ( $8-30 \mathrm{~min}$.). The generality and the efficiency of this method were also proven by new CIR examples of electron rich aryl halides that gave excellent results ( $73-92 \%$ ), as compared to conventional literature conditions, when no product formation was detected.

Table 10 MACIR experiments with electron rich electron aryl halides.

## Spectroscopic Data

Most characteristically in ${ }^{1} \mathrm{H}$ NMR, and as an indication for the successful CIR, are the resonances of the $(E)$-olefinic protons of the chalcones. They appear as doublets, in the range of $\delta 7.05-7.92$, with large trans coupling constants $J=15.5-18.9 \mathrm{~Hz}$. In some cases, ( $\mathbf{4 a}$ and 4e) variable mixtures of $Z / E$-configurated chalcones (up to $1: 4$ ) could be observed, wherein the lower coupling constants, $J=12.5-12.8 \mathrm{~Hz}$, were assigned to the $Z$-configurated chalcones. Due to the electron withdrawal effect of the ring B (Fig. 4) in the chalcones $\mathbf{4 a - j}$ or the electron donating effect of the ring $B$ in the chalcones $\mathbf{4 1}-\mathbf{o}$, the signals of the olefinic protons are accordingly shifted to lower fields (up to $\delta 7.92$ in the case of chalcone $\mathbf{4 f}$ ) or to higher fields respectively (up to $\delta 7.05$ in the case of chalcone $\mathbf{4 n}$ ). However, the conjugation through the chalcone shifts the signals of the olefinic protons from the usual values to lower field. The aromatic protons display typical chemical shifts in the range of $\delta 6.70-8.77$. The lowest field, $\delta 8.77$, was found for the pyrimidine protons of chalcone $\mathbf{4 b}$, and the most upfield shift for the protons ortho positioned to the methoxy group of chalcone $\mathbf{4 n}, \delta 6.70$. The signals of the ethoxy protons of chalcone $\mathbf{4 e}$ are detected as a triplet at $\delta 1.41$ and a quartet at $\delta 4.39$ with a coupling constant of 6.9 Hz .
${ }^{13} \mathrm{C}$ NMR resonances appear for $\alpha, \beta$-unsaturated ketones between $\delta 188.4$ and 190.7, where the signals at lower field, $\delta 190.7$, are for $\mathbf{4 m}$ and $\mathbf{4 o}$. The carbon nucleus of the ester group in $\mathbf{4 e}$ resonates, as expected, at higher field, $\delta 165.7$.

The carbon nuclei of the nitrile groups for $\mathbf{4 a}, \mathbf{4 h}, \mathbf{4 i}$ and $\mathbf{4} \mathbf{j}$ resonate in the range of $\delta$ 118.3-122.1. The other signals for the aromatic carbon nuclei are detected between $\delta$ 112.9-166.3.

The mass spectra of all the obtained compounds display the molecular peaks. The fragmentation mode leads to the loss of the $\mathrm{NH}_{2}, \mathrm{CH}_{3}, \mathrm{OCH}_{3}$ and $\mathrm{OC}_{2} \mathrm{H}_{5}$ groups for the chalcones $\mathbf{4 e}, \mathbf{4 g}, \mathbf{4 m}, \mathbf{4 n}$ and $\mathbf{4 o}$ respectively.

For all chalcones, $\alpha$-fragmentation at the carbonyl group, a characteristic feature of ketones, could be examined. The C-C bonds are lightly to break on both sites leading to the typical fragments (Table 11).

Table 11 The Fragmentation of selected chalcones 4 (EI, 70 eV )
Compound

The $\alpha$-fragments lose the CO group ( $\mathrm{M}^{+}-28$ ) leading to the corresponding peaks of significantly lower intensity, however still detectable.

The stretching vibrations of carbonyl groups for $\alpha, \beta$-unsaturated ketones 4 give rise to a strong and distinctive IR absorbtion in the range of $1675-1656 \mathrm{~cm}^{-1}$. Another characteristic band at $2223-2230 \mathrm{~cm}^{-1}$ can be assigned to the nitrile groups, even if the vibration is slightly downshifted due to the conjugation with the aromatic ring.

In addition, the absorptions of highly polarized double bonds in the IR spectra of $\alpha, \beta$ unsaturated ketones, 4 are detected at $1589-1568 \mathrm{~cm}^{-1}$.

Moreover, the structure of $\mathbf{4 b}$ is unambiguously supported by an X-ray analysis (Fig. 7). The chalcone structure is almost planar, with a dihedral angle of $16.39^{\circ}$ between the aromatic rings. The dihedral angle of the $\alpha, \beta$-unsaturated ketone moiety is $5.19^{\circ}$.

Fig. 7 ORTEP plot of compound $\mathbf{4 b}$.

## 4.2 [3+2+1] Pyridine Derivatives Synthesis Based upon CIR

### 4.2.1 Pyridines - Literature Review

Among six membered aromatic heterocycles the pyridyl core ${ }^{52}$ adopts a central role. In nature, pyridine is the constituting structural unit in the coenzyme vitamin $\mathrm{B}_{6}$ family (pyridoxal, pyridoxol, pyridoxamine) and an important subunit in numerous alkaloids ${ }^{53}$ (Fig. 8).

(antibacterial agent)

Fig. 8 Naturally occurring pyridine derivatives.

Many relatively simple 3-alkylpyridines alkaloids extracted from marine organisms have already been used or tested for their biological activity. For example, the antileukemic and antineoplastic theonelladins C and D were isolated from Okinawan marine sponge theonella swinhoei. ${ }^{54}$ The antileukemic niphatesines C and D and the cytotoxic and antimicrobial niphatesine $G$ have been obtained from the Okinawan marine sponge niphates sp. ${ }^{55}$ The cytotoxic ikimines A-C have been isolated from a Micronesian sponge. ${ }^{56}$ The antimicrobial xestamine C comes from a Caribbean sponge xestospongia wiedenmayeri, whilethe antimicrobial xestamines D-H have been extracted from a Bahamian sponge calyx podatypa ${ }^{57}$ (Fig. 9).

Fig. 9 Some naturally occuring pyridine alkaloids

In pharmaceutical chemistry, also highly substituted ${ }^{58}$ and annealed ${ }^{59}$ pyridines, like 6,7-dihydro-5 H -[1]pyrindines and 5,6,7,8-tetrahydroquinolines, have recently gained considerable interest as antiarteriosclerotics since they efficiently inhibit HMG-CoA reductase and cholesterol transport proteins. Besides, the classes of pyrindine, tetrahydroquinoline and naphthyridine derivatives additionally display antimycobacterial, ${ }^{60}$ fungicidal and bactericidal, ${ }^{61}$ antiulcer, ${ }^{62}$ antivertigo, ${ }^{63}$ antiviral, ${ }^{64}$ and anti-inflammatory activities. ${ }^{65}$

The pyridines also find broad applications as versatile building blocks in the syntheses of natural products and as ligands in supramolecular coordination chemistry. In the past few decades luminescent metal complexes based on polypyridine ligands, have already been used in various fields such as solar energy conversion, ${ }^{66}$ information storage, ${ }^{67}$ photocleavage of DNA, ${ }^{68}$ and oxygen sensors ${ }^{69}$ due to to their long-lived metal-to-ligand charge-transfer (MLCT) excited states.

Although many methods have been reported for the synthesis of the pyridine heterocyles, due to their great importance, the development of novel and efficient synthetic methods remains an active research area.

A literature overview reveals the large number of preparation approaches proposed for ring-pyridine construction that include (a) [5+1] type ring annulations from a nitrogen derivative and a five-carbon fragment, usually a 1,5 -diketone, ${ }^{70}$ (b) $[2+2+2]$ type reactions of substituted acetylenes and nitriles, (c) [3+3] cyclizations of chalcones and iminophosphoranes, ${ }^{71}$ Bohlmann-Rathtz pyridine synthesis from $\beta$-amino-crotonates and alkynones and cyclocondensation of 1,3-diketones with enaminones, ${ }^{72}$ (d) [4+2] reactions of unsaturated imines with enolates and intramolecular $6 \pi$-electrocyclization of aza-unsaturated compounds, ${ }^{73}$ (e) $[3+2+1]$ reaction of $\alpha$-benzotriazolyl ketones with $\alpha, \beta$-unsaturated ketones, ${ }^{74}$ (f) $[2+2+1+1]$ Hantzsch dihydropyridine synthesis followed by subsequent oxidation. Besides the condensation and cycloaddition approaches, there are exceptions, such as ring expansion from 5 -membered rings, but these methods are generally low-yielding and narrow in applicability.

A straightforward protocol is the transition metal mediated cycloaddition of alkynes and nitriles, method (b). Although a variety of stoichiometric methods have been described, ${ }^{75}$ catalytic systems are restricted to $\mathrm{Fe}, \mathrm{Rh}, \mathrm{Co}, \mathrm{Ni}$ and Ru complexes. ${ }^{76}$ Both Fe and Rh systems need elevated temperatures and afford more arene byproducts than the desired pyridine. ${ }^{77}$ Cobalt catalyzed methods are versatile, but suffer from a main drawback: except for symmetrical alkynes or reaction yielding fused pyridines, regioisomers are produced (Scheme 28).

Scheme 28 Two different terminal alkynes react with one nitrile to afford eight different pyridines.

For symmetrical alkynes, the substitution pattern is limited to either the $2,4,6$ or the 2,5,6-trisubstituted pyridines ${ }^{78}$ (Scheme 29).

Scheme 29 Addition of a nitrile to three possible cobaltacyclopentadienes furnishing only $2,4,6$ - and $2,5,6$-pyridine isomers.

In general, milder conditions are employed with Ru catalysts. Nevertheless, substrates are currently limited to activated nitriles (e.g., cyanides). ${ }^{79}$ Complete regioselectivity was observed using a Ni catalyst for both intramolecular (Scheme 30) and intermolecular reactions, ${ }^{76 \mathrm{c}}$ although the substitution pattern is also limited.

Scheme 30 Nickel catalyzed cycloaddition of alkynes and nitrile.
Among [3+3] approaches (method c) one of the most important is Bohlmann-Rahtz synthesis (Scheme 31).

Scheme 31 Bohlmann-Rahtz synthesis
Elevated temperatures in the dehydration step can be avoided by performing the condensation under acidic conditions (Scheme 32). However, poor yields were obtained for aromatic substituents, $\mathrm{R}^{4.80}$

Scheme 32 Improved conditions for Bohlmann-Rahtz pyridine synthesis.

The Bohlmann-Rahtz procedure served as key step in the synthesis of the thiopeptide promothiocin A, an antibiotic, ${ }^{81}$ and for dimethyl sulfocinamate, an important synthon for sulfomycin antibiotics. ${ }^{82}$

The most straightforward [4+2] cycloaddtion approach to pyridines (method d) involves a Diels-Alder reaction of 1 -azadienes with alkene or alkyne followed by subsequent oxidation. However, this route is rarely used, as the Diels-Alder reaction is disfavoured on electronic, conformational and thermodynamic grounds. A method modification consists in the introduction of an electron donating group on nitrogen, which is subsequently eliminated (Scheme 33).

Scheme 33 Diels-Alder reaction of 1-azadiene.

This methodology was used by Boger in his approach to the rubrolone aglycon, an alkaloid isolated from streptomyces enchinoruber, by an intramolcular hetero-Diels-Alder cycloaddition ${ }^{83}$ (Scheme 34).

Scheme 34 Key-step in rubrolone synthesis.

Due to the intransigence of 1 -azadienes [4+2] cycloadditions, the use of a variety of heterocyclic azadiene in an inverse demand Diels-Alder reaction, followed by either the extrusion of a part of the resulting bicycle in a retro-[4+2] reaction or the scission of the resulting bridge, has become a favoured method for constructing pyridine rings. ${ }^{84}$ Despite of the use of a large excess of electron rich dienophile, the yields are moderate.

Using $[3+2+1]$ type of reaction (method e) Katritzky et al. have recently reported the reaction of $\alpha, \beta$-unsaturated ketones and $\alpha$-benzotriazolyl ketones that furnish the 2,4,6 trisubstituted pyridines in quite good yields, but the synthesis of $\alpha$-benzotriazolyl ketones decreases the overall yields of this procedure. ${ }^{85}$

The most important $[2+2+1+1]$ approach (method f) is the classical Hantzsch multicomponent dihydropyridine synthesis followed by oxidation. This route suffers of several limitations with respect of substitution patterns. The products incorporate acyl or carbonyl groups in the 3 and 5-positions.

Among the numerous synthetic approaches to highly substituted pyridines, the novel multicomponent strategies, comparable to the powerful, classical Hantzsch dihydropyridine synthesis, ${ }^{86}$ remain particularly challenging.

### 4.2.2 One-Pot Four-Component CIR-Enamine Addition-Cyclocondensation Pyridine Synthesis

Facile accesses to unsymmetrical pyridines by cocondensation of Michael acceptors with enols, enamines or stabilized ylids and ammonia ${ }^{87}$ represent an intriguing starting point for the development of a novel multicomponent reaction, in particular, with respect to the generation of combinatorial libraries. From this point of view, a four-component reaction is most attractive, as it allows, by individual variations of the components, to generate large diversity of products.

In previous chapters it was shown that CIR is the most elegant and atom-economic way of transforming aryl halides into chalcones, highly reactive Michael acceptors, that readily react with all kinds of mono- and bidentate nucleophiles. Therefore, chalcones have directly been subjected, in a one-pot fashion, to the reaction with enamines and ammonium chloride providing access to substituted and annelated pyridines.

Hence, a novel four-component pyridine synthesis based upon a CIR, followed by a consecutive enamine cycloaddition and a concluding cyclocondensation with ammonium
chloride was developed. The retrosynthetic scheme for the pyridine synthesis via a couplingisomerization sequence provides aryl bromides, propargyl alcohols and ammonium chloride as readily available starting materials (Scheme 35).

Scheme 35 Retrosynthetic concept of consecutive one-pot four-component pyridine synthesis.

Product analysis suggests that the intermediate is either a keto enamine or a cycloadduct, as a consequence of a Michael addition or a Diels-Alder reaction with inverse electron demand ${ }^{88}$ between an enamine and a chalcone. The aqueous work-up of the intermediate does not help in the structure elucidation of the intermediate, since the hydrolysis product in both cases is a 1,5-diketone (Scheme 36).

Scheme 36 Hydrolitic formation of 1,5-diketones.

Therefore, in order to elucidate the reaction pathway, according to Katritzky, ${ }^{89}$ after CIR of $\mathbf{1 a}$ and $\mathbf{2 a}$ furnishing the chalcone $\mathbf{4 a}$, and after subsequent addition of enamine $\mathbf{5 c}$ followed by reaction at room temperature for 72 h , suitable single crystals of the cycloadduct $\mathbf{6}$ were isolated by careful crystallization of the crude product from petroleum ether (Scheme 37, Fig. 10).

Scheme 37 Coupling-isomerization-cycloaddition sequence.

Fig. 10 ORTEP plot of cycloadduct 6

The proton NMR spectrum of the isolated product shows the appearance of a signal at $\delta$ 5.25 and unambiguously indicates the formation of a vinyl ether that can be attributed to a cycloadduct. Formally, the formation of the endo-product 6 is the result of a concerted or stepwise [4+2] cycloaddition. The intermediacy of $\mathbf{6}$ in the CI-enamine addition reaction is also in full agreement with the observed stereochemistry in the diketone, which can be considered to be the hydrolysis product of the cyclic aminal 6 .

Molecular modeling of alternative reaction pathways (Fig. 11), i.e. concerted and stepwise [4+2] cycloaddition and ene reaction, respectively, was performed on the PM3 level of theory, ${ }^{90}$ both in gas phase and water. ${ }^{91}$ The results of the computations reveal that, although the heat of formation of the ene product, i.e. the enamino ketone 7, is thermodynamically slightly favoured over the cycloadduct $\mathbf{6}$, under kinetic control a stepwise [4+2] cycloaddition occurs most likely. In particular, in polar solvents the formation of the dipolar iminium enolate $\mathbf{8}$ as an intermediate in the rate determining step most likely concludes to the 1,6-dipolar cyclization of the zwitter ion $\mathbf{8}$ to give the experimentally observed reaction product 6 .

Fig. 11 Calculated PM3 energies $\left[\mathrm{kcalmol}^{-1}\right]$ of the addition of an enamine to a chalcone in solution and in the gas phase (in parentheses). Imaginary frequencies that verify transition states: ${ }^{[a]}{ }^{1} 473.2 \mathrm{~cm}^{-1},{ }^{[b]}{ }_{i} 735.1 \mathrm{~cm}^{-1},{ }^{[c]}{ }_{i} 100.9 \mathrm{~cm}^{-1},{ }^{[d]}{ }^{1} 947.2 \mathrm{~cm}^{-1},{ }^{[e]} 1487.4 \mathrm{~cm}^{-1}$.

After the coupling-isomerization reaction and the subsequent enamine cycloaddition, the final step of this new one-pot four-component reaction begins with the protonation of the cycloadduct with acetic acid to give a reactive electrophilic iminium ion that now initiates the concluding cyclocondensation step with ammonium chloride or benzyl amine.

Thus, applying electron poor (hetero)aryl halides $\mathbf{1}$ and aryl propynols $\mathbf{2}$ to the conditions of the CIR, and after complete conversion to the corresponding chalcones, adding (hetero)cyclic and a cyclic morpholino enamines 5 to the reaction mixture and, finally, adding ammonium chloride 9 in the presence of acetic acid tetrahydro-[1,6]naphthyridines 10a-d, pyrindines 10e-h, tetrahydroquinolines 10i-k, tri(hetero)aryl pyridines $\mathbf{1 0 l} \mathbf{- o}$ were formed in moderate to good yields as colourless crystals (Scheme 38, Table 12).

then: $\mathrm{NH}_{4} \mathrm{Cl}(\mathbf{9 )}$
acetic acid, $\Delta$

Scheme 38 Four-component synthesis of annealed and substituted pyridines $\mathbf{1 0}$ based upon a CIR-enamine addition-cyclocondensation sequence.

Conformationally fixed enamines like $N$-morpholino cyclopentene, cyclohexene or tetrahydropyridine, or enamines of acetophenone derivatives smoothly react in the enamine addition step, and finally lead to the formation of annealed or substituted pyridines (Table 12). Acyclic disubstituted enamines rather give a mixture of products and were, therefore, not considered for further investigation.

## Spectroscopic Data

The structure of the pyridine derivatives $\mathbf{1 0}$ is unambiguously supported by the expected appearance of the characteristic proton and carbon resonances and multiplicities. In particular, in the ${ }^{1} \mathrm{H}$ NMR spectra of $\mathbf{1 0}$ the diagnostic singlets for the pyridine methine signals, appearing between $\delta 7.5$ and 8.5 , are applied for the assignments of the ortho phenyl or phenylene doublets by 2D NOESY spectra, indicating clear cross-peaks as a consequence of spatial proximity. Likewise, the structure of naphthyridines 10a-d can be established by thorough inspection of 2D NOESY correlations between the methylene groups in the saturated ring appearing as singlets at $\delta 4.5-4.9$ and the proximal methine resonances steming from the electron poor (hetero)aryl substituent. The signals for the ethyl protons for 10a-d are detected as a multiplet in the range of $\delta 1.18-1.26$, with an intensity of 3 protons and a quartet in the range of $\delta 4.05-4.12$, with coupling constants of $J 7.0-7.1 \mathrm{~Hz}$.

Characteristically for the dihydropyrindines $\mathbf{1 0 e} \mathbf{- h}$ are the downfieldshifted signals of the methylene protons that appear as triplets in the range of $\delta 3.01-3.38$, with coupling constants of $J 7.3-7.8 \mathrm{~Hz}$. Similarly, the methylene protons of the tetrahydronaphthyridines $\mathbf{1 0 i} \mathbf{-} \mathbf{k}$, are detected as triplets, in the range of $\delta 2.59-3.11$, with coupling constants of $6.4-6.6 \mathrm{~Hz}$.

The mass spectra of all obtained compounds show the molecular peaks. The usual fragmentation mode for all pyridine derivatives leads to the loss of phenyl fragments. For 10a-d the loss of ethyl and carboethoxy groups were detected.

The vibrations of CN group in 10a, 10i and $\mathbf{1 0 1}$ were identified at $2224-2227 \mathrm{~cm}^{-1}$ in the IR spectra.

Furthermore, the structures of pyrindines, tetrahydroquinolines, and naphthyridines $\mathbf{1 0}$ were corroborated by X-ray crystal structure analyses of compounds $\mathbf{1 0 a}, \mathbf{1 0 f}, \mathbf{1 0 g}, \mathbf{1 0 j}, \mathbf{1 0 k}$ and 10n (Fig. 12-Fig. 17).

## 4.3 [3+3] Dihydropyridine and Pyridine Syntheses Based upon CIR

### 4.3.1 Dihydropyridines - Literature Review

First mentioned by Hantzsch ${ }^{92}$ almost one century ago, dialkyl 1,4-dihydro-2,6-dimethylpyridine-3,5-dicarboxylates (1,4-DHP) have now been recognized as vital drugs in the treatment of angina and hypertension. Some of them (amlodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, Fig. 18) have been commercialized and it has been proven that their therapeutic success is related to their efficacy to bind to calcium channels, and consequently to decrease the passage of the transmembrane calcium current, associated in smooth muscle with a long lasting relaxation and in cardiac muscles with a reduction of contractility throughout the heart. ${ }^{93}$

amlodipine

felodipine

isradipine

lacidipine

nicardipine

nifedipine

Fig. 18 Calcium channel blocker pyridines.

The usefulness of the calcium antagonists has led to the development of novel synthetic strategies ${ }^{94}$ to improve the classical Hantzsch dihydropyridine synthesis, (Scheme 39) and microwave activation stands among the alternative routes proposed the past decade. ${ }^{95}$

Scheme 39 Hantzsch Synthesis.

Recently, Santander et al. ${ }^{96}$ reported a modified Hantzsch 1,4-dihydropyridines synthesis, starting with the condensation of nitrobenzaldehyde with $\alpha, \beta$-ketoesters and subsequent cyclocondensation with alkyl 3-amino crotonates (Scheme 40).

Scheme 40 Modified Hantzsch dihydropyridine synthesis.

Aromatization of 1,4-DHP has also attracted considerable attention in recent years as Böcker ${ }^{97}$ has demonstrated that metabolism of those drugs involves a cytochrome P-450 catalyzed oxidation in the liver. The so-obtained pyridines are devoid of the pharmacological activity of the parent heterocycles and are further transformed by additional chemical modifications. Due to the biological importance of the oxidation step of 1,4 -DHP, the reaction
has been the subject of a large number of studies and a plethora of reagents has been utilized to mimic the in vivo transformation. ${ }^{98}$

Jacobson et al. ${ }^{99}$ showed that both the dihydropyridine and the corresponding pyridine derivatives are good antagonist for $\mathrm{A}_{3}$ adenosine receptor and, therefore, potential antiinflamatory, antihismatic and antiischemic agents. They also found defined common pharmacophore elements for pyridine and dihydropyridine structures, e.g., ester group and 6phenyl group using molecular modelling based on the steric and electrostatic alignment (SEAL) method. Moreover, a relationship between affinity and hydrophobicity was examined for the pyridines.

### 4.3.2 One-Pot Three-Component CIR-Enamine Addition-Cyclocondensation Dihydropyridine and Pyridine Syntheses

The great importance of 1,4-dihydropyridines and their corresponding pyridine derivatives prompted us to develop a new one-pot, three-components synthesis, using coupling-isomerization, enamine addition, cyclocondensation sequence, in one-pot fashion. Thus, upon performing the CIR with the aryl halides $\mathbf{1}$ and the propargyl alcohol 2a followed by the addition of ethyl 3 -amino crotonate $\mathbf{1 1}$ as a suitable enamine in the presence of acetic acid and under nitrogen, in a few cases the expected dihydropyridines $\mathbf{1 2}$ could be isolated (Scheme 41).

$$

\text { 12b: } \mathrm{Ar}^{1}=p-\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{CF}_{3}(37 \%) & \text { 13b: } \mathrm{Ar}^{1}=2 \text {-pyrimidyl }(50 \%) \\
& \text { 13c: } \mathrm{Ar}^{1}=2 \text {-thiazolyl }(26 \%) \\
& \text { 13d: } \mathrm{Ar}^{1}=2 \text {-pyridyl }(26 \%)
\end{array}
$$

Scheme 41 Three-component synthesis of functionalized dihydropyridines $\mathbf{1 2}$ and pyridines $\mathbf{1 3}$ based upon a CIR-enamine addition-cyclocondensation sequence.

Table 13 One-pot synthesis of dihydropyridines 13 and pyridines 14.
Aryl halide

Entry | Propargyl |
| :---: |
| alcohol 2 |

[^1]However, either under aerobic (compound 13a) or anaerobic conditions in most cases the aromatization readily furnishes the ethyl nicotinoate derivatives $\mathbf{1 3}$ in moderate yields.

Again, in this three-component pyridine synthesis as before in the four-component sequence, the oxidative aromatization of the actual dihydropyridine intermediate readily occurs under the reaction conditions assisted by the presence of the palladium and copper species that obviously catalyze this final step in the sequence. A moderate substituent effect in this dehydrogenating aromatization can be attributed to the fact that only for slightly weaker acceptors such as cyano and trifluoromethyl groups give rise to the isolation of the dihydropyridine intermediate. Although, the three-component pyridine synthesis opens an entry to further functionalized pyridines such as ethyl nicotinoate derivatives $\mathbf{1 3}$, the yields of the four-component sequence are consistently higher.

## Spectroscopic data

The formation of the dihydropyridines $\mathbf{1 2}$ and pyridines $\mathbf{1 3}$ is unequivocally supported by the appearance of the characteristic methine proton resonances in the ${ }^{1} \mathrm{H}$ NMR spectra as multiplets at $\delta 5.0$ for dihydropyridines $\mathbf{1 2}$ and as singlets between $\delta 7.5$ and 8.5 for ethyl nicotinoate derivatives 13. The ethyl proton resonances for all dihydropyridines $\mathbf{1 2}$ and pyridines $\mathbf{1 3}$, are detected as triplets in the range of $\delta 1.01-1.27$ with a coupling constant of $J$ 7.0 Hz , and quintets in the range of $\delta 3.86-4.36$ with a coupling constant of $J 7.0 \mathrm{~Hz}$. The methyl protons of all dihydropyridine and pyridine derivatives resonate in the range of $\delta 2.3-2.90$, as singlets.

The mass spectra of all obtained compounds show the molecular peaks. The usual fragmentation mode for all dihydropyridines and pyridines leads to the loss of ethyl and carboxyethyl fragments.

Besides the mass spectrometric, IR spectroscopic, and combustion analytical data are in agreement with the suggested molecular structure of the dihydropyridines $\mathbf{1 2}$ and ethyl nicotinoate derivatives 13. Additionally, the structures of the nicotinoates $\mathbf{1 3}$ were corroborated by X-ray crystal structure analyses of compounds 13a, 13b, and 13c (Fig. 19-Fig. 21).

## 4.4 [4+2] 2-Ethoxy Pyridine Synthesis Based upon CIR

### 4.4.1 Synthesis of $N$-Propargyl Tosyl Amides

The azomethine 16 were synthesized according to the standard literature procedure, ${ }^{100}$ from the corresponding aromatic aldehydes, 14, and tosylamine, $\mathbf{1 7}$ (Scheme 42). The acid catalyzed reaction is performed in toluene using the Dean-Stark water-trap.

Toluene

Scheme 42 Synthesis of azomethine 16.

The azomethines 16 were reacted with ethynylmagmesium bromide, 17, according to Brandsma, ${ }^{101}$ to furnish the desired propargyl tosylamine 18 in excellent yields (Scheme 43).

Scheme 43 Synthesis of $N$-propargyl tosyl amide 18.

### 4.4.2 Enimine Synthesis Based upon CIR

Recently we have reported an extension of the CIR to $N$-propargyl tosyl amide substrates that opens a new and efficient access to $N$-tosyl-enimines (Scheme 44). ${ }^{102}$

Scheme 44 CIR access to $N$-tosyl enimines 19 from propargyl $N$-tosyl amides 18.

Although the electron deficient 1 -azadienes do not easily participate in [4+2] cycloadditions, $N$-tosyl-enimines are more suitable for Diels-Alder reactions with inverse electron demand due to the tosyl group with an excellent leaving group propensity. Therefore, their increased reactivity towards cycloadditions, with the formation of new heterocycle derivatives, motivated us to synthesize a series of new $N$-tosyl-enimines with a diversified substitution pattern.

Thus, electron deficient aromatic and heteroaromatic halides 1 and $N$-[1-(hetero)aryl-prop-2-ynyl] tosyl amides $\mathbf{1 8}$ were submitted to the reaction conditions of the CIR in a boiling mixture of triethylamine and THF to give after trituration of the crude products in ethanol the $N$-tosyl enimines 19a-e in excellent yields (Table 14). However, it should be mentioned that, due to the hydrolytic sensitivity of enamine functionality, column chromatography often led to the isolation of the corresponding chalcones. Therefore, purification of the crude enimines is most efficiently achieved by recristallization from ethanol, or ethyl acetate/hexane mixtures.

### 4.4.3 One-Pot Three-Component CIR-Ketene Acetal-Cycloaddition Syntheses of 2-Ethoxy Pyridines

The aza Diels-Alder reaction has become an important synthetic route to pyridines and several recent reviews discuss the scope and limitation of this versatile methodology. ${ }^{103}$

The electron rich 1-azabutadienes are well known to undergo facile HOMO-diene controlled $[4+2]$ cycloadditions, ${ }^{104}$ but the $4 \pi$-participation of the electron deficient 1 -azadiene is reported ${ }^{105}$ to suffer from low conversion, competitive [2+2] addition, and low reactivity due to an unfavorable s-cis/s-trans equilibrium, tautomerism of $\gamma$-alkyl substituted 1 -azadienes to enamines precluding [4+2] addition and instability of endocyclic enamine products. In the last decade some successful methods have been proposed for the $4 \pi$-participation of electron deficient 1 -azabutadienes in LUMO-diene controlled hetero-Diels-Alder reactions, among these the use of $N$-sulfonyl ${ }^{84 b-d}$ substituents is particularly notable, although the aromatization of the corresponding cycloadducts, does not take place unless strong bases or oxidation agents are added. Nevertheless the electron-poor 1-azadienes, despite their potential as heterodienes in Diels-Alder reactions, have received much less attention.

Scheme 45 Three-component synthesis of 2-ethoxy pyridines 21.

As shown previously, the $N$-tosyl enimines (19), readily available by CIR of (hetero)aryl halides (1) with N -propargyl tosyl amides (18), offer the advantage compared to other electron deficient 1 -azadienes, of a good leaving group that facilitates their participation to the [4+2] cycloadditions. These properties were exploited in one-pot multcomponent pyridine syntheses based upon CIR-ketene acetal-cycloaddition sequence (Scheme 45, Table 15).

Thus, after performing the CIR with the aryl halides $\mathbf{1}$ and the $N$-propargyl tosyl amides 18 the electron rich diethyl ketene acetal 20 was added to the reaction mixture. After reaction times of 24-48 h, the 2-ethoxy pyridines 21 were isolated in moderate to good yields as colorless to yellow crystals or as light yellow oil.

Mechanistically, the formation of 2-ethoxypyridines 21 can be rationalized by either a concerted or stepwise [4+2] cycloaddition of the transient $N$-tosyl enimine 19 to furnish a tetrahydropyridine intermediate. However, the excellent leaving group propensity of the $N$-tosyl group could lead to a base induced elimination giving rise to a dihydropyridine that rapidly eliminates ethanol with concomitant aromatization, thereby, concluding the formation of the aromatic pyridine core.

In conclusion, we have demonstrated that the CIR can successfully be extended to the synthesis of $N$-tosyl enimines starting from propargyl $N$-tosyl amides. These electron deficient heterodienes are perfectly suited as reaction partners in Diels-Alder reactions with inverse electron demand. Therefore, we designed a one-pot three-component synthesis of 2-ethoxy pyridines by CIR-cyclocondensation sequence. This novel consecutive pyridine synthesis not only enhances molecular and structural diversity in a combinatorial sense and potentially in solid phase applications, but also allows a rapid construction of complex multicore heterocyclic arrays.

Table 15 Three-component synthesis of 2-ethoxy pyridine synthesis 21.
No. (Hetero)Aryl ${ }^{1} \mathrm{Hal}, 1$

Spectroscopic data

The structure of the 2-ethoxy-6-(p-anisyl)pyridines 21 is unambiguously supported by the expected appearance of the characteristic proton and carbon resonances and multiplicities. In particular, in the ${ }^{1} \mathrm{H}$-NMR spectra of $\mathbf{2 1}$ the diagnostic triplets for the ethoxy methyl proton signals at $\delta 1.35-1.46(J 7.1 \mathrm{~Hz})$ and the quartets for the ethoxy methylene protons at $\delta 4.39-4.53(J 7.1 \mathrm{~Hz})$ are applied for the assignments of the 3-methine doublets of the newly formed pyridyl core at $\delta 6.73-7.05(J 1.3 \mathrm{~Hz})$ by NOESY spectra, indicating clear cross-peaks as a consequence of spatial proximity (Fig. 22).

Fig. 22 Assignment of the chemical shifts in ${ }^{1} \mathrm{H}$ NMR for pyridine 21.

The signals of the methoxy protons are detected as singlets, in the range of $\delta 3.73-3.86$.
Additionally, the mass spectrometric, IR spectroscopic, and combustion analytical data are in full agreement with the suggested molecular structure of the 2-ethoxy pyridines $\mathbf{2 1}$. The mass spectra of all obtained compounds show the molecular peaks. The usual fragmentation mode for all pyridines leads to the loss of ethyl, methyl and carboxymethyl fragments. Furthermore, the structure of $\mathbf{2 1}$ is corroborated by an X-ray crystal structure analysis of compound 21e (Fig. 23).

Fig. 23 ORTEP plot of compound 21 e.

## 4.5 [4+2] Synthesis of Annelated 2-Amino Pyridines Based upon CIR

### 4.5.1 Annelated 2-Amino Pyridines - Literature Review

Annelated 2-amino pyridines where the amino group is an endo constituent of the annelated saturated ring are pharmaceutically intriguing structures. In particular, pyrrolo[2,3-b]pyridines or 7 -azaindolines, ${ }^{106} \quad[1,8]$ naphthyridines, ${ }^{107}$ and pyrido[2,3-b]azepines, ${ }^{108}$ have received considerable interest as a consequence of their broad pharmacological activities among which anti-inflammatory, antibacterial, antitumour, cardiotonic and anticonvulsivant properties.

Recently, Hartman et al., ${ }^{107 e}$ have identified the 5,6,7,8-tetrahydro[1,8]naphthyridine (THN) moiety as a lipofilic, moderately basic $N$-terminus that provides molecules with excellent potency and selectivity for the integrin receptor $\alpha_{v} \beta_{3}$, therefore good antiosteoporosis agents (Fig. 24).

$\mathrm{IC}_{50} 3 \mathrm{nM}$
(inhibition of rat osteoclast-mediated bone resorption in vivo)

Fig. 24 THN-derivative - inhibitor of bone resorption.

For a convenient access to new potential biologically active 2 -amino annelated pyridines, it is essential that reliable, flexible and general synthetic methods to be readily available. However, the various synthetic routes towards these compounds are limited with respect to yields and scope.

As a recent example, Zard et al., ${ }^{109}$ reported a synthetic route involving a tin free-radical-mediated cyclization onto the pyridine ring as the key step (Scheme 46).

Scheme 46 Free radical mediated synthesis of 7-azaindolines and tetrahydro[1,8]naphthyridines.

Despite its flexibility towards 5 to 7-membered annelated ring ( $\mathrm{n}=1-3$ ), the method furnished the desired compounds only in poor overall yields (15-57 \%).

### 4.5.2 Synthesis of Ketene $N, S$-Acetals as Electron Rich Dienophiles for [4+2] Cycloadditions

Ketene $N, S$-acetals are widely used as electron rich dienophiles ${ }^{110}$ for [4+2] cycloaddition reactions. They were synthesized in a three step sequence starting from the corresponding cyclic amides 22, according to Thomsen et al. ${ }^{111}$ By thionation with Lawesson's reagent the amides $\mathbf{2 2}$ were converted into the the thiocarbonyl compounds $\mathbf{2 3}$ in excellent yields ( $85-95 \%$ ). After methylation with methyl iodide and recrystallizsation from acetone $S$-alkylated iodide salts $\mathbf{2 4}(75-90 \%)$ were treated with potassium tert.-butoxide to furnish the $N, S$-ketene acetals 25 in moderate overall yields ( $35-65 \%$, Scheme 47).

Scheme 47 Three-steps synthesis of ketene $N, S$-acetals.

### 4.5.3 One-Pot Three-Component CIR-Ketene Acetals-Cycloaddition Synthesis of Pyrrolo[2,3-b]pyridines, [1,8]Naphthyridines and Pyrido[2,3-b]azepines

Based upon our experience in diversity oriented heterocycle syntheses in a consecutive one-pot fashion and preliminary studies on CIR-cycloaddition sequences, ${ }^{112}$ the retrosynthetic analysis of 5-, 6-, and 7-membered annelated amino pyridines based upon the CI-approach (Scheme 48) suggests enimines as key intermediates. Since $N, S$-ketene acetals are fairly electron rich dienophiles for $[4+2]$ cycloadditions with inverse electron demand a facile threecomponent CI-cycloaddition-aromatization synthesis of annelated 2-amino pyridines can be easily envisioned.

Scheme 48 Retrosynthetic concept of a consecutive one-pot three-component annelated 2amino pyridine synthesis.

Thus, we submitted $p$-bromo benzonitrile (1a), 2-bromo pyrimidine (1b), or 2-bromo pyridine (1c) and $N$-[1-aryl-prop-2-ynyl] tosyl amides 18, and after some reaction time cyclic $N, S$-ketene acetals $\mathbf{2 5}$ to the reaction conditions of the CIR in boiling mixture of THF and triethylamine. After aqueous workup the annelated 2-aminopyridines 27 were obtained in 3166 \% yield as light yellow crystalline solids (27a-e, 26g-i) or brown oils (27f, 27i) (Scheme 49, Table 16).

The tentative mechanism of this one-pot sequence can be described as follows (Scheme 50). After the CIR of the electron-deficient (hetero)aryl halide 1 and the propargyl tosyl amides 18 furnishing an enimine 19 the added $N, S$-ketene acetal $\mathbf{2 5}$ readily undergoes a [4+2]
cycloadditions with inverse electron demand with 19 to give the annelated tetrahydropyridine 26 as the expected cycloadduct. However, under the reaction conditions the twofold baseassisted elimination of tolylsulfinate and methyl mercaptane from 26 furnishes upon aromatization the annelated pyridine 27.

Scheme 50 Mechanistic rationale of the CIR-Diels-Alder-aromatization sequence.

In conclusion, the mild reaction conditions of the CI sequence of electron poor (hetero)aryl halides with 1 -aryl propargyl $N$-tosyl amines giving rise to enimines, can be extended to a one-pot three-component synthesis of annelated 2 -amino pyridines, such as pyrrolo[2,3-b]pyridines, [1,8]naphthyridines, and pyrido[2,3-b]azepines, applying a cycloaddition with $N, S$-ketene acetals and subsequent aromatization. This methodology combines modern catalytic cross-coupling processes with pericyclic reactions and, therefore, opens new one-pot synthetic strategies as a consequence of mild reaction conditions and functional group compatibility.

Moreover all annelated 2-amino pyridines display pronounced blue or green fluorescence (see spectral data) that can be controlled by reversible protonation in weakly acidic media for pyrido[2,3-b]azepines. Therefore, the fluorescence dyes, synthesized in a
modular diversity oriented fashion are ideal candidates for fluorescence labels for studying pH dependent and pH alternating cellular processes.

Spectroscopic data

The structures of the annulation products 27 were unambiguously assigned by ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$, COSY, and NOESY NMR experiments. Most characteristically, in the ${ }^{1} \mathrm{H}$ NMR spectra of 27 the appearance of the methine singlets at $\delta 6.87-7.81$ can be clearly attributed to the formation of pentasubstituted pyridyl core unit. In addition, the signals of $N$-methyl protons are found as singlets at $\delta 3.02-3.22$.

The mass spectra of all compounds show the molecular peaks. The usual fragmentation mode for all pyridine derivatives leads to the loss of methyl fragment.

Furthermore, the mass spectrometric and IR spectroscopic data are in full agreement with structural assignments.

All annelated 2-amino pyridines 27 absorb in the UV between 338 and 392 nm (Table 17). As a consequence of steric interactions between the annelated ring and the acceptor substituents in the position 4 of the central pyridine ring the latter are twisted out of coplanarity with increasing conformational bias of the annulated moiety. Hence, the longest wavelength maxima are found for the pyrrolo[2,3-b]pyridines 27a-c. Furthermore, these longest wave length $\pi-\pi^{*}$ transitions, also reflecting the $\mathrm{S}_{0}-\mathrm{S}_{1}$ excitation, display dominant charge transfer character with a significant mutual HOMO-LUMO overlap in a conformationally flexible 4-acceptor pyridyl framework. This is also nicely supported by calculations on the DFT level of theory (B3LYP G-31** density functional) ${ }^{113}$ performed on the 2-pyrimidyl substituted pyrrolo[2,3-b]pyrimidine 27b (Fig. 26) and the pyrido[2,3$b$ azepine 27i (Fig. 27). The increase of steric bias upon enlarging the annelated five membered to a seven membered ring affects the orbital overlap and correlates with the absorption energy. Therefore, in all series the absorption maxima are bathochromically shifted upon increasing the acceptor strength of the substituent at position 4 of the pyridine moiety from 2-pyridyl over p-cyanophenyl to 2-pyrimidyl.

$$
{ }^{\mathrm{a}} \Delta \tilde{v}=1 / \lambda_{\max , \text { abs }}-1 / \lambda_{\max , \mathrm{em}}\left[\mathrm{~cm}^{-1}\right] .
$$

Fig. 25 Solid-state fluorescence of single crystals of 27a (left) and 27b (right).

Fig. 26 LUMO (top) and HOMO (bottom) of the pyrrolo[2,3-b]pyrimidine 27b.

Fig. 27 LUMO (top) and HOMO (bottom) of the pyrido[2,3-b]azepine 27i.

Furthermore, all annelated 2-amino pyridines 27 emit blue ( $\mathbf{2 7 d} \mathbf{- h}, \mathbf{2 7 j}$ ) or green light (27a-c, 27i) upon excitation at the corresponding absorption wavelengths (Table 17). The Stokes shifts are rather pronounced and lie between 4200 and $9600 \mathrm{~cm}^{-1}$. For all representatives the quantum yields $\Phi_{f}$ were determined. ${ }^{114}$ Pyrrolo[2,3-b]pyridines (27a-c) fluoresce with significantly higher quantum yields ( $\Phi_{f}=32-63 \%$ ) than $[1,8]$ naphthyridines
$\left(\mathbf{2 7 d}-\mathbf{f}, \Phi_{f}=12-25 \%\right)$, and pyrido[2,3-b]azepines $\left(\mathbf{2 7} \mathbf{g}-\mathbf{j}, \Phi_{f}=15-34 \%\right)$. The longest wavelength emission maxima, however, are found in the series of pyrido[2,3-b]azepines. As pointed out before for the absorption properties the emission behavior is as well affected by steric biases that control the efficiency of the spontaneous emission. Therefore, the charge transfer character of the HOMO-LUMO transition responsible for the electronic absorption spectra is well reflected in the torsion dependent emission efficiency from the excited $\mathrm{S}_{1}$ state. ${ }^{115}$

The presence of a basic pyridyl nitrogen in the annelated 2-amino pyridines 27 invites to scrutinize the pH -dependence of the absorption and emission properties (Table 3). A discrete halochromicity can be detected for the 2-pyrimidyl substituted pyrrolo[2,3-b]pyridine 27b and the pyrido[2,3-b]azepine 27i, where bathochromic shifts of the longest wave length absorption maxima are found by lowering the pH from pH 9 (27b: $384 \mathrm{~nm}, \mathbf{2 7 i}: 372 \mathrm{~nm}$ ) to pH 1 (27b: 392 nm ) or pH 4 (27i: 380 nm ). This decrease of the HOMO-LUMO gap upon protonation is also reproduced in DFT calculations (B3LYP G-31** density functional) ${ }^{113}$ on $\mathbf{2 7 b}, \mathbf{2 7 b}-\mathbf{H}^{+}, \mathbf{2 8 i}$, and $\mathbf{2 7 i} \mathbf{-} \mathbf{H}^{+}$. For the couple $\mathbf{2 7 b} / \mathbf{2 7 b}-\mathbf{H}^{+}$the HOMO-LUMO gap reduces slightly upon protonation (27b: $\Delta_{\text {номо-цимо }} 3.35 \mathrm{eV} ; \mathbf{2 7 b}-\mathbf{H}^{+}$: $\Delta_{\text {номо-димо }} 3.29 \mathrm{eV}$ ) whereas the decrease of the HOMO-LUMO gap is larger for the couple 27i/27i-H ${ }^{+}$(27i: $\Delta_{\text {Hомо-димо }}$ $3.50 \mathrm{eV} ; 27 \mathrm{i}-\mathbf{H}^{+}$: $\Delta_{\text {номо-димо }} 3.38 \mathrm{eV}$ ). However, the emission behavior is even more affected from protonation than the absorption properties. The emission spectra of the 2-pyrimidyl substituted pyrrolo[2,3-b]pyridine 27b (Fig. 28) and the pyrido[2,3-b]azepine 27i (Fig. 29) display a quite different behavior upon altering the $\mathrm{p} H$. Whereas for the pyrrolo[2,3-b]pyridine 27b the emission maximum only shifts slightly upon protonation (478 nm at $\mathrm{pH} 9 ; 482 \mathrm{~nm}$ at pH 1), for the pyrido[2,3-b]azepine 27i a significant bathochromic shift from 478 nm at pH 9 to 512 nm at pH 4 is observed. In the latter case protonation of the pyridyl nitrogen is obviously occurring at higher $\mathrm{p} K_{a}$ as a consequence of an increase in basicity. Again, the steric bias causes a twist out of coplanarity of the 2-pyridyl substituent (vide supra) and, hence, exerts a diminished electron withdrawing effect. The appearance of the fluorescence spectra of $\mathbf{2 7 b}$ and $\mathbf{2 7 i}$ with shoulders at longer wavelengths indicates that dual fluorescence of these donor-acceptor substituted pyridines is obviously responsible for the variable pH -sensitivity. In the former system the 2 -pyrimidyl substituent is already coplanar with the pyridine in the ground state and the geometrical changes upon protonation are only minimal, whereas in the latter fluorophore the $\mathrm{S}_{0}-\mathrm{S}_{1}$ excitation from the pyridyl core to the pyrimidine occurs with dominant charge transfer character to an excited state that is coplanar and has to relax to a twisted state again. All this makes the
pyrido[2,3-b]azepine 27i a pH -sensitive fluorescence sensor that can be operative in neutral and weakly acidic media.

Table 18 Selected UV/Vis and fluorescence properties (recorded in 0.1 M acetate buffered DMSO solution, $T=298 \mathrm{~K}$ ) and calculated HOMO and LUMO energies of pyrrolo[2,3-b]pyridines 27b and pyrido[2,3-b]azepine 27i.

Finally, the structure of 27 was unambiguously supported by X-ray crystal structure analyses of compounds 27a, 27b, 27e, 27h, and 27j (Fig. 30-Fig. 34). Depending on the conformational bias of the annelated ring the steric interactions force the acceptor substituted (hetero)aryl ring to twist out of coplanarity with the pyridyl core. The interplanar angle of $p$ cyano phenyl ring and the central pyridine moiety increases from the pyrrolo[2,3-b]pyridine 27a $\left(42.4^{\circ}\right)$ over the pyrido[2,3-b]azepine $\mathbf{2 7 h}\left(64.6^{\circ}\right)$ to the $[1,8]$ naphthyridine $\mathbf{2 7 e}\left(88.8^{\circ}\right)$. However, 2-pyrimidyl substituents as shown in the crystal structure analysis of $\mathbf{2 7} \mathbf{c}$ (5.5 ${ }^{\circ}$ ) impose the least steric bias.

### 4.6 One-Pot Microwave-Assisted Multicomponent Synthesis of Cyclohexadienes and Cyclohexenone Derivatives Based upon CIR

In previous chapters it was shown that Sonogashira coupling-ismerizations offer the most elegant and atom-economic way of transforming electron poor arylhalides into chalcones. Moreover, microwave-assisted CIR, not only reduces reaction times, but also inserts electron donating arylhalides as reactive halides in CIR, now completing the generality of the CIR.

The excellent results obtained for the microwave-assisted CIR, encouraged me to investigate the microwave effect on the CIR-enamine addition-cyclocondensation multicomponent reactions, where conventional procedures furnished only moderate yields.

### 4.6.1 Synthesis of $\boldsymbol{\beta}$-Enaminones

$\beta$-Enaminones are interesting building-blocks due to their ability to function as both ambident nucleophiles and electrophiles. ${ }^{116}$ Typical electrophilic positions are C-3 (alkylamino methylene group) and C-1 (the carbonyl group). Secondly, $\beta$-enaminones exhibit enamine character towards electrophiles, with a nucleophilic position at C-2 (Fig. 35).

Fig. 35 Reactivity of $\beta$-enaminones.

The $\beta$-enaminones $\mathbf{3 0}$ can be easily synthesized by a condensation reaction between 1,3-dicarbonylic compounds 28 and substituted amines 29, under acidic conditions, in boiling benzene, using Dean-Stark trap ${ }^{117}$ (Scheme 51).

Scheme 51 Synthesis of $\beta$-enaminones 30.
The condensation reaction can be applied for a large variety of substrates, furnishing $\beta$-enaminones in excellent yields (70-98 \%, Table 19).

Table 19 Synthesis of $\beta$-enaminones 30.
$-C_{3}$

### 4.6.2 One-Pot Synthesis of Cyclohexadienes and Cyclohexenones

In previous chapters it has already been shown that $\beta$-enaminones, as the source of nitrogen in a $[3+3]$ cycloaddition reaction with chalcones, gave rise to the formation of dihydropyridines that oxidised to the corresponding pyridines, in moderate overall yields. Following the same mechanistic rationale, the $N$-substituted enaminones, in a $[3+3]$ cyclocondensation fashion, would inhibit the subsequent oxidation step and open a new entry to the asymmetrical dihydropyridines. But, similarly to literature reports on Hantzsch synthesis, where the use of primary amine as a source of nitrogen led to the low yields or no reaction, ${ }^{118}$ all attempts of the conventional thermal cyclocondensations of chalcones with N substituted enaminones gave poor yields of a mixture of products: the dihydropyridines and the unexpected cyclohexadienes (Scheme 52).

Scheme 52 Thermal conditions CIR-enamine addition-cyclocondesation multicomponent synthesis.

As microwave heating not only reduces the reaction times from hours to minutes, facilitating as well, the optimization studies, but also minimizes the side reactions, increases yields and improves reproducibility, I decided to apply this procedure on CIR-enamine-addition-cyclocondensation multicomponent reactions.

Thus, upon performing MACIR with aryl halides $\mathbf{1}$ and the propargylic alcohols $\mathbf{2}$ and subsequent addition of enaminones $\mathbf{3 0}$, in presence of acetic acid, in one-pot fashion, various intramolecular aldol-type products could be isolated, as cyclohexadienes $\mathbf{3 1}$ and cyclohexenones 32 (Scheme 53, Table 20). The effect of microwave irradiation allowed these compounds to be formed within a few minutes, in high yields (45-74\%) via a one-pot CIR-enamine addition-condensation reaction.

The use of microwaves was successfully extended to the Sonogashira couplingisomerization (CIR) and was found to be very effective for the new multicomponent syntheses of cyclohexadienes and cyclohexenones.

The enamine cycloaddition to the chalcone and the subsequent acidic catalysed ring opening and intramolecular aldol-condensation reaction take place in one step, in 10-20 minutes at $150^{\circ} \mathrm{C}$, under microwave irradiation.

Acidic conditions are crucial for the ring opening reaction, since no product formation was observed in the absence of acid.

Although, the aldol-condensation reaction is also a base-catalyzed reaction no product formation was detected using different base catalysts ( $\mathrm{KO}^{i} \mathrm{Pr}, \mathrm{KOH}, \mathrm{Na}_{2} \mathrm{CO}_{3}$, Table 21).

The investigation on the process optimization showed that the amount of enamine is also important for product formation. The optimal amount was found for an excess of 3:1 enamine:chalcone (Table 21).

| 3 | 0.75 | 10 | 68 |

The nature of $N$-substituents, $\mathrm{R}^{2}$, on the enamines, plays an important role. The $N$-alkylsubstituted enaminones undergo more readily the addition reactions than the corresponding N -aryl-substituted enaminones. A plausible explanation is the decrease of the enamine reactivity towards addition with the loss of nucleophilicity by the conjugation with the aromatic ring. Accordingly, using the enamine 30f, (Table 19) no product formation was observed. This drawback is avoided by the insertion of a donor substituent on the aromatic substituent of the enaminone, as for the enamine $\mathbf{3 0} \mathbf{c}$, although the yield of the coresponding cyclohexadiene is rather poor, $30 \%$, entry 11 (Table 20).

The substituent $R^{1}$ of the enamines influences the stability of the product (7) towards hydrolysis, so a higher electronic withdrawing effect of the carbonyl group on the enamine, increases the stability of cyclohexadiene (31). Decreasing the electron withdrawal effect of the carbonyl group, as in the case of the amide group, the corresponding cyclohexadiene (31) is more susceptible towards hydrolysis (Scheme 53).

Thus, submitting the (hetero)aryl halides $\mathbf{1}$ and propargylic alcohols $\mathbf{2}$ to the microwaveconditions of the Sonogashira coupling-isomerization and subsequent amide-enamine addition under acidic conditions, and after aqueous work up, the cyclohexenones 32 were obtained in few minutes, 25-35 minutes, in good to excellent yields (Table 22).

Mechanistically, the formation of the cyclohexadienes $\mathbf{3 1}$ and cyclohexanones $\mathbf{3 2}$ presumes the formation of the $[4+2]$ cycloadducts $\mathbf{3 3}$ which in acidic conditions open to the iminium ions 35 that now readilly undergo an acid catalyzed aldol condensation.

Scheme 54 Mechanistic rationale for CIR-enamine addition-aldol condensation sequence.

The cyclohexanones $\mathbf{3 2}$ are formed upon an in situ hydrolisys of the enamine moiety that is facilitated by the acidic reaction conditions (Scheme 54).

Spectroscopic data

The structures of cyclohexadiene $\mathbf{3 1}$ and cyclohexanone $\mathbf{3 2}$ were unambiguously assigned by ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$, COSY, HMBC and NOESY NMR experiments. Characteristically, in the ${ }^{1} \mathrm{H}$ NMR spectra of $\mathbf{3 1}$ and $\mathbf{3 2}$ is the appearance of the olefinic proton resonances as dublets, at $\delta 6.31-6.89$, with coupling constants of ${ }^{4} J=1.9-2.8 \mathrm{~Hz}$. The long range coupling between the $4-\mathrm{H}$ olefinic protons and the $6-\mathrm{H}$ methylenic protons can be unambiguously assigned from the cross-peak in the COSY NMR spectra (Fig. 36). Cross-peaks were also detected between the olefinic 4-H protons and the ortho-phenyl or heteroaryl ( $-\mathrm{Ar}^{2}$ ) protons by 2D NOESY experiments.

31

32

Fig. 36 The numeration of cyclohexadiene 31 and cyclohexenone 32.

The NH enamine protons for 31a-l were detected as triplets in the range of $\delta$ 11.7-11.85, with coupling constants of $4.8-6.0 \mathrm{~Hz}$ and an intensity of one proton. These downfieldshifted NH resonances suggest a six-membered intramolecular hydrogen bonding. The sufficiently slow proton exchanges in $\mathrm{DMSO}_{6} \mathrm{D}_{6}$, at room temperature, allowed the detection of the vicinal couplings ${ }^{3} \mathrm{~J}$ between CH-NH protons.

Broad singlets at low field between $\delta 8.86$ and 10.92 , were assigned to the NH protons of the indol moiety for $\mathbf{3 1 a}-\mathbf{h}$.

The 1-H methine protons resonances for $\mathbf{3 1 a} \mathbf{- f}, \mathbf{g}$ and $\mathbf{3 1} \mathbf{j}-\mathbf{l}$ were found in the range of $\delta 4.13-4.32$ as doublets, with coupling contants between $J 5.25-8.0 \mathrm{~Hz}$. For $\mathbf{3 1 g}$,i they were identified as doublets of doublets with coupling constants of $6.5,7.75 \mathrm{~Hz}$ (axial-axial coupling) and 1.25 and 1.75 Hz as a consequence of equatorial-equatorial or axial-equatorial coupling.

The resonances of the methylenic protons $6-\mathrm{H}$ are more complex, due to the additional geminal coupling. Thus, for 31i,j one of the methylenic proton signal appears as doublet of doublet at $\delta 2.98\left({ }^{2} J=16.8 \mathrm{~Hz},{ }^{3} J=2.0 \mathrm{~Hz}\right)$ and $\delta 3.51\left({ }^{2} J=16.8,{ }^{3} J=1.8 \mathrm{~Hz}\right)$ respectively, and the other one as doblet of doublets of doublets at $\delta 3.17(J=16.8 \mathrm{~Hz}, J=7.8 \mathrm{~Hz}$, $J=2.5 \mathrm{~Hz})$ and at $\delta 3.02(J=16.8 \mathrm{~Hz}, J=7.6, J=2.9 \mathrm{~Hz})$ respectively. For the cyclohexadiene $\mathbf{3 1 a} \mathbf{-} \mathbf{h}$ and $\mathbf{3 1} \mathbf{j} \mathbf{- l}$ the resonances of the 6 -methylenic protons are detected as a set of doublets of doublets of doublets in the range of $\delta 2.52-3.14$. The $n$-butyl protons for the cyclohexadienes $\mathbf{3 1 i} \mathbf{i} \mathbf{k}$ were identified as sets of signals, triplets at $\delta 0.90-0.91$ with a coupling constant between $J 7.25-7.3 \mathrm{~Hz}$, and three multiplets in the range of $\delta 1.31-1.52$, 1.52-1.69 and 3.31-3.58.

Characteristically for the cyclohexenones 32a-i are the protons of the two $N$-methyl groups that resonate in the ${ }^{1} \mathrm{H}$ NMR in the range of $\delta 2.66-2.75$ and $\delta 2.81-3.14$ as singlets.

Additionally, the mass spectrometric, IR spectroscopic, and combustion analytical data are in full agreement with the suggested molecular structure of the cyclohexadienes $\mathbf{3 1}$ and cyclohexenones 32. The mass spectra of all obtained compounds show the molecular peaks. The usual fragmentation mode for the cyclohexadiene 31 leads to the loss of acetyl groups and for the cyclohexenones $\mathbf{3 2}$ to the loss of $N, N$-dimethyl amido fragments (Table 23).

Table 23 Fragmentation of selected cyclohexadienes $\mathbf{3 1}$ and cyclohexenones $\mathbf{3 2}$.

| Compound | Fragment | $m / z$ <br> (\%) | Fragment | $m / z$ <br> (\%) | Fragment | $\mathrm{m} / \mathrm{z}$ (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 31a |  | $\begin{aligned} & 414 \\ & (12) \end{aligned}$ |  | $\begin{gathered} 130 \\ (100) \end{gathered}$ | $=\mathrm{o}^{+}$ | $\begin{gathered} 43 \\ (18) \end{gathered}$ |

### 4.7 One-Pot Microwave-Assisted Quinoline Synthesis Based upon MACIR

### 4.7.1 Quinolines - Literature review

Quinoline derivatives represent a major class of heterocycles, and a number of preparations have been known since the late 1800s. The quinoline ring system occurs in various natural products, especially in alkaloids. The quinoline skeleton is often used for the design of many synthetic compounds with diverse pharmacological properties. In 1820, quinine (Fig. 42) was isolated as the active ingredient from the bark of Cinchona trees and successively replaced the crude bark for the treatment of malaria. Despite its relatively low efficacy and tolerability, quinine still plays an important role in the treatment of multiresistant malaria. ${ }^{119}$ Malaria is one of the most devastating infectious diseases in the world, afflicting 200-500 milion people and killing 1-2 milion annually. ${ }^{120}$ The worldwide increase in drugresistance to many of the affordable chemotherapies, such as chloroquine, has created a demand for the development of new malaria treatments, among them, mefloquine, quinacrine and other quinoline compounds. ${ }^{121}$

chimanine $B$

alkaloid with in vitro activity against HIV-1 replication $\left(\mathrm{IC}_{50}=7.9 \mu \mathrm{M}\right)$

alkaloid with in vitro activity against HIV-1 replication $\left(\mathrm{IC}_{50}=2.9 \mu \mathrm{M}\right)$

Fig. 42 Naturally occuring quinolines.

Chimanine alkaloids, simple quinolines, isolated from the bark of galipea longiflora trees of the rutaceae family, ${ }^{122}$ are effective against the parasitic diseases such as
leishmaniasis and trypanosomiasis. The leishmaniases ${ }^{123}$ constitute a diverse group of diseases that varies from simple cutaneous leishmaniasis to visceral leishmaniasis (VL), a very fatal disease if left untreated. VL, also known as "kala-azar" is a severe disease and epidepimcs are generally devastating. More recently, VL has also gained attention as an opportunistic infection in AIDS. Owing to the fact that overlapping geographical distribution of leishmaniasis and HIV/AIDS is increasing, Leishmania-HIV co-infection has been regarded as an emerging infectious disease.

Figadere et al. ${ }^{124}$ synthesized a serie of 2-substituted quinolines similar with chimanine alkaloids that present in vitro activity against the causal agents of cutaneous leishmaniasis, visceral leishmaniasis, African trypanosomiasis and Caga's disease. Furthermore, several quinolines also demonstrated in vitro activity against HIV-1 replication (Fig. 42).

Thus, substituted quinolines have found attractive applications as pharmaceuticals (antimalarials, antibacterials, protein kinase inhibitors) NADH models, and agrochemicals, in coordination chemistry as ligands ${ }^{125}$ as well as being general synthetic blocks. ${ }^{126}$

Although numerous elegant syntheses have been developed for quinolines, because of their great importance, it is still challenging to explore new and efficient synthetic routes for this class of compounds, particularly those with wide general applicability.

Among the various routes available for the synthesis of quinoline derivatives, particularly interesting seems the approach employing aromatic primary amines as the nucleophilic nitrogen donating component as C-C-N unit and electrophilic three-carbon unit, usually carbonyl compounds, referring to Skraup, Doebner-von Miller, Combes and ConradLimpach syntheses ${ }^{127}$ (Scheme 55).

The classical Skraup and Doebner von Miller synthesis are very similar, the former involves heating anilines with acrolein, generated in situ from glycerol and strong acid, whereas the latter method is based on generating a substituted acrolein, both methods also requiring an oxidant. The Combes method involves heating anilines with acetylacetone (Scheme 55).

Skraup
synthesis
Doebner-Miller synthesis

Scheme 55 Approaches involving aromatic primary amine as C-C-N unit.

In spite of their generality, versatility and simplicity, these syntheses have considerable drawbacks, such as harsh reaction conditions and highly acidic medium, which makes them tedious to isolate the product from the crude mixture. Moreover, reactions of meta- or 3,4disubstituted anilines normally give a mixture of regioisomers, which are also difficult to separate. In case of Combes synthesis, the use of unsymmetrical 1,3-diketones complicates separation process.

Another way of preparing quinoline derivatives uses ortho-substituted anilines (C-C-CN unit) and two carbon unit, usually carbonyl compounds containing a reactive $\alpha$ - methylene group. Aniline derivatives substituted at the 2-position and $o$-substituted nitrobenzenes are frequently employed as starting materials. The Friedländer synthesis of quinolines from $o$-aminobenzaldehydes is a staple reaction of organic synthesis. Although it does not require a catalyst, the Friedländer synthesis can be acid- or base-catalyzed. The uncatalyzed Friedländer synthesis requires more drastic reaction conditions, with temperatures in the range $150-220^{\circ} \mathrm{C}$. Hydrochloric acid, sulfuric acid, $p$-toluenesulfonic acid, and polyphosphoric acid were widely employed as catalysts. A complicating factor in this reaction is the relative instability of the ortho-amino aldehyde, which can readily undergo self-condensation reactions. The Pfitzinger reaction, the Niemantowski reaction and the Borsche synthesis ${ }^{128}$ are helpful in reducing problems due to $o$-aminobenzaldehyde instability.

Due to these synthetic problems, there is still a need for developing mild, regioselective and practical syntheses for these heterocycles.

Therefore, new metal-catalyzed coupling cyclizations or acid catalyzed cycloadditions of appropriate precursors come to compete with classical syntheses in efficacy and rapidity of the quinoline construction. The formation of quinoline skeletons has been attempted by remarkable catalytic action of transition metal catalysts such as palladium, rhodium, ruthenium, cobalt and iron complexes. ${ }^{129}$ It was suggested that metal-catalyzed heteroannulation proceeds via amine exchange reaction between anilines and alkylamines, allyl alcohols or 1,3-diols. For instance, anilines react with 3-amino-1-propanol in dioxane at $180{ }^{\circ} \mathrm{C}$ in the presence of catalytic amounts of $\mathrm{RuCl}_{3}$ in $\mathrm{H}_{2} \mathrm{O} / \mathrm{PPh}_{3}$ and $\mathrm{SnCl}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ together with hydrogen acceptor (acetone, nitrobenzene or hex-1-ene) to afford the corresponding quinolines in moderate yields (29-46\%). ${ }^{130}$ The use of triallylamine and ruthenium (III) chloride and bis(diphenylphosphino) methane allowed to obtain the 3-ethyl-3-methylquinoline derivatives in high yields ${ }^{131}$ (Scheme 56). The quinoline yield was not decisively affected by the electronic nature and the position of the substituent on aniline.

Scheme 56 Ruthenium-catalyzed quinoline synthesis.

Akiyama and co-workers ${ }^{132}$ described a novel quinoline synthesis that proceeds via catalytically tungsten vinylidene complexes - $\mathrm{W}(\mathrm{CO})_{5}(\mathrm{THF})$. Alkynyl imines underwent [4+2] electrocyclization in the presence of $20 \mathrm{~mol} \%$ catalyst to give 2-arylquinolines in good yields (Scheme 57).

Scheme 57 Tungsten-catalyzed quinoline synthesis

The elevated temperature for the ruthenium-catalyzed quinoline synthesis and the starting material that are not readily available, in case of the cobalt- ${ }^{133}$ and tungsten-catalyzed reactions, ${ }^{134}$ do not make these methods versatile and attracting procedures.

An interesting access to 2 -substituted quinolines, recently reported by Shim et al., ${ }^{135}$ makes use of a base-mediated consecutive isomerization and cyclization sequence of 3-(2-aminophenyl)-1-arylprop-2-yn-1-ols that are easily available by Sonogashira coupling of iodoaniline with propargyl alcohols (Scheme 58).

62-89 \%

Scheme 58 Quinoline synthesis by isomerization-cyclocondensation of 3-(2-aminophenyl)-1-arylprop-2-yn-1-ols.

Remarkable for this approach is that the electron rich coupling compounds do not undergo isomerization to the corresponding enones even after prolonged reaction time or elevated temperature ( $180^{\circ} \mathrm{C}$ ). Stronger anorganic bases, such as KOH , were required that the isomerization took place by refluxing in ethanol for several hours (7-20 h).

### 4.7.2 Quinoline Synthesis Based upon MACIR

Microwave irradiation facilites the electron rich aryl halides to undergo successfully coupling-isomerization reactions. Para- and meta- donating groups, as methoxy as well as amino groups substituents at the aromatic ring are well tolerated in the MACIR conditions. Aryl halides with an amino group in ortho position would be even more nucleophilic. Generally, ortho positions are not favored due to the steric hindrance, but in this case, the CIR product would be an unsaturated 1-amino 5-carbonyl compound that under base conditions of the MACIR could easily undergo an intramolecular condensation reaction with the formation of a new 6 -membered ring. Indeed, subjecting $o$-amino (hetero)aryl halides $\mathbf{1}$ and propargyl alcohols 2 to the MACIR conditions, after 30 minutes reaction time, I was able to isolate the corresponding quinoline derivatives 41 in good to excellent yields (57-92 \%, Scheme 59, Table 24).

Scheme 59 Quinoline Synthesis Based upon MACIR.

Furthermore starting with the disubstituted 1,5-diamino 2,4-diiodobenzene $\mathbf{1 r}$, the twofold coupling-isomerization reaction followed by intramolecular condensation furnished the expected pyrido-quinoline derivative 41i (Scheme 60).

Scheme 60 Synthesis of pyrido-quinoline derivative $41 \mathbf{i}$ via twofold MACIR

The coupling-isomerization reaction and the intramolecular condensation take place in one step, without the isolation of the intermediates 38 and 39. Performing the reaction at lower temperature, $120^{\circ} \mathrm{C}$ the alkyne 38 could be isolated as the main product, entry 6 (Table 24).

Mechanistically, the formation of the quinoline core presumes a $(Z)-(E)$ isomerization that might readily occur under the MACIR conditions, followed by an intramolecular condensation. The isomerization may be favorized by the intramolecular hydrogen bond formation.

In conclusion, a new efficient one-pot quinoline and related heterocycles synthesis was developed as a direct application of the MACIR of the $o$-amino (hetero)aryl halides with propargyl aclcohols. Moreover, this new method allowed the synthesis of the naturally occurring quinolines, as 2-phenylquinoline, 41a, and chimanine B, 41f, within 30 minutes, in good to excellent yields (40-81 \%). (Table 24) These quinolines have already been tested as antileishmanial agents, presenting good in vitro activity $\left(\mathrm{IC}_{50}=12-100 \mu M\right)$. Further investigations for the new 2-quinolines as potential antileishmanial agents are in progress.

[^2]Spectroscopic data

The structure of the quinoline derivatives $\mathbf{4 1 a - f}, \mathbf{i}$ and naphthyridines $\mathbf{4 1 g}, \mathbf{h}$ is unambiguously supported by the expected appearance of the characteristic proton and carbon resonances and multiplicities. In particular, in the ${ }^{1} \mathrm{H}$ NMR spectra of $\mathbf{4 1}$ the doublets for the 3-, 4- methine signals, appear between $\delta 7.89$ and 8.27 , with coupling constants $J=8.0-8.3 \mathrm{~Hz}$. Additionally, the assignments of 3-positioned methine protons are supported by 2D NOESY spectra that indicate clear cross-peaks as a consequence of spatial proximity with ortho-phenyl, phenylene, or 3-thienyl protons (- $\mathrm{Ar}^{2}$, Fig. 43).

Fig. 43 The numeration of the quinolines and naphthyridines 41.

The thienyl protons for $\mathbf{4 1 b}$ are identified as a triplet at $\delta 7.16$ with a coupling constant of $J=4.0 \mathrm{~Hz}$, a doublet at $\delta 7.61$ with a coupling constant of $J=5.0 \mathrm{~Hz}$, and a multiplet at 7.69, each of them with an intensity of one proton. The signals of the methyl protons for 41d and $\mathbf{4 1 g}$ are detected as singlets at $\delta 3.89$ and 2.54 respectively, with an intensity of three protons. The resonances of the methyl protons for $\mathbf{3 8}$ and $\mathbf{4 1 f}$ appear as a doublet at $\delta 1.69$ with a coupling constant of $J=6.3 \mathrm{~Hz}$, and at $\delta 2.1$ with a coupling constant of $J=6.9 \mathrm{~Hz}$ respectively. The broad singlets in ${ }^{1} \mathrm{H}$ NMR spectrum of compound $\mathbf{3 8}$, appear at $\delta 2.64$ and 4.06 respectively. They clearly support the non-cyclic structure of the alkyn-ol derivative. The characteristic $\alpha$-cleavage detected in the mass spectrum of $\mathbf{3 8}$ also confirms the alcohol structure. The most downshifted signal in ${ }^{1} \mathrm{H}$ NMR spectrum of compound 41f, was assigned to the proton positioned ortho with respect of the pyridine cores that resonate at $\delta 8.77$ as singlet with an intensity of one proton.

The mass spectra of all obtained compounds show the molecular peaks. The usual fragmentation mode for the 2-substituted quinoline and naphthyridine derivatives leads to the loss of phenyl and thienyl fragments. For 41d,g the loss of methyl group was detected. For 41c, the cyanohydric acid was identified as a fragment in the mass spectrum.

The nitrile vibration was detected in the IR spectrum of compound 41c at $2224-2227 \mathrm{~cm}^{-1}$.

Furthermore, the structure of quinolines was corroborated by X-ray crystal structure analysis of compound 41c.

Fig. 44 ORTEP plot of compound 41c.

## 5 Conclusions and Outlook

It was shown that the major goals in methodological studies on coupling-isomerization reaction, as the reduction of reaction times of the rate limiting isomerization step and reduction of the amount of base could be achieved by the use of the microwave assisted CIR (MACIR). Furthermore, the microwave-assisted coupling-isomerization reaction was successfully extended to electron rich aryl halides that commonly do not undergo CIR under conventional conditions. As a direct application of MACIR of electron rich aryl halides, a novel one-pot synthesis of quinoline derivatives was developed via MACIR of $o$-amino aryl halides with propargyl alcohols. Based upon this methodology, chimanine alkaloids were synthesized in 30 minutes, $40-81 \%$. New rapid and efficient syntheses of the pyrido-quinoline derivatives as multidentate ligands can be envisioned by use of this methodology.

Also the microwave effects on multicomponent synthesis were investigated. Thus, while conventional heated muticomponent processes furnished pyridines or dihydropyridines as main reaction products by a CIR-enamine addition cyclocondensation sequence, in 48-72 h, the same reaction components under microwave irradiation underwent a CIR-enamine addition-intra-aldol condensation sequence, with the formation of the cyclohexadienes or cyclohexanones as main reaction products, within 25-35 minutes.

The potential of MACIR-enamine addition-intra-aldol condensation sequence is not limited to the reactions described in this thesis. The microwave assisted three component syntheses might be further developed to new four-component processes. For example, the cyclohexadienes can be subjected to subsequent Lewis acid catalyzed Diels-Alder or PictetSpengler reactions in one-pot fashion. Similarly, the keto-cyclohexadiene can be used in 1,3-cycloaddition reactions for the synthesis of new annelated heterocycles.

The mechanism of enamine addition to the chalcones under conventional heating conditions was elucidated by the isolation of the Diels-Alder cycloadduct 6. This result was also confirmed by the molecular modeling investigations.

It was discovered that the enimines, as products of CIR of aryl halides with propargyl amines, could be used as electron poor heterodienes in a Diels-Alder reaction with inverse electron demand, furnishing pyridine derivatives, among them, interesting fluorescent 2-amino annelated pyridines with high florescence quantum yields of 12-63 \%.

## 6 Experimental Part

### 6.1 General Considerations

All reactions involving palladium-copper catalysis were performed in degassed oxygen free solvents under a nitrogen atmosphere using Schlenk and syringe techniques. Halogen compounds 1, $\left(\mathrm{Ph}_{3} \mathrm{P}\right)_{2} \mathrm{PdCl}_{2}$, and CuI were purchased reagent grade from ACROS, Aldrich, Fluka or Merck and used without further purification. Triethylamine and THF were dried and distilled according to standard procedures. ${ }^{103}$ All reactions involving microwave irradiation were conducted under nitrogen in heavy-walled glass Smith process vials sealed with aluminum crimp caps fitted with a silicon septum. The inner diameter of the vial filled to the height of 2 cm was 1.3 cm . The microwave heating was performed in a Smith Synthesizer single-mode microwave cavity producing continuous irradiation at 2450 MHz (Personal Chemistry AB, Uppsala, Sweden). Reaction mixtures were stirred with a magnetic stir bar during the irradiation. The temperature, pressure and irradiation power were monitored during the course of the reaction. The average pressure during the reaction was 3-4 bar. After completed irradiation, the reaction tube was cooled with highpressure air until the temperature had fallen below $39{ }^{\circ} \mathrm{C}$ (ca. 2 min ). - Column chromatography: silica gel 60 (Merck, Darmstadt), mesh 70-230. TLC: silica gel plates ( $60 \mathrm{~F}_{254}$ Merck, Darmstadt). Melting points (uncorrected values): Büchi Melting Point B-540. - ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra: Bruker ARX 300, Varian VXR 400S $\mathrm{CDCl}_{3}, \mathrm{C}_{2} \mathrm{D}_{6} \mathrm{O}$ and $\left[\mathrm{D}_{6}\right]$ DMSO. The assignments of quaternary C CH , $\mathrm{CH}_{2}$ and $\mathrm{CH}_{3}$ have been made by using DEPT spectra. - IR: Perkin Elmer Lambda 3. UV/vis: Perkin Elmer Models Lambda 16. - Fluorescence: Perkin Elmer LS-55. - MS: Finnigan MAT 90 and MAT 95 Q. - Elemental analysis were carried out in the Microanalytical Laboratories of the Organisch-Chemisches Institut, Ruprecht-KarlsUniversität Heidelberg.

### 6.2 General Procedure for the Coupling Reactions/Coupling-Isomerization Reactions of Aryl halides 1 with Propargylyl Alcohols 2

A magnetically stirred solution of 1.00 mmol of halogen compound $\mathbf{1}, 1.05 \mathrm{mmols}$ of propargyl alcohol 2, $20 \mathrm{mg}(0.02 \mathrm{mmols})$ of $\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{PdCl}_{2}$, and $2 \mathrm{mg}(0.01 \mathrm{mmols})$ of CuI in 2-5 eq. of degassed base and 1.5 mL of THF under nitrogen was stirred under nitrogen in a heavy-walled SmithCreator process vial at the microwave generated temperature and for the
time indicated, (for experimental details see Table 25) in the microwave cavity. After cooling to room temp. the reaction mixture was poured to 40 mL of ethyl acetate and 40 mL of water were added and stirring was continued for 5 to 10 min . The aqueous layer was extracted with ethyl acetate $(4 \times 15 \mathrm{~mL})$ and the combined organic phases were dried over magnesium sulfate. After filtration the solvents were removed in vacuo and the residue was chromatographed on silica gel (hexane/ethyl acetate $4: 1$ or $1: 1$ ) and crystallized from ethanol or pentane/chloroform (1:1) to give the analytically pure alkyne $\mathbf{3}$ and chalcone $\mathbf{4}$, respectively.

### 6.3 General Procedure for the Coupling-Isomerization-Enamine-Addition-Amino-Cyclocondensation Sequence to Pyridines 10

A magnetically stirred solution of 1.0-2.0 mmols of $\mathbf{1}, 1.05-2.8 \mathrm{mmols}$ of propargyl alcohol 2, 28 mg ( 0.04 mmols ) of $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}$, and $4 \mathrm{mg}(0.02 \mathrm{mmols})$ of CuI in 4 mL of a degassed mixture of triethylamine and THF (3:1) or in 4 mL of triethylamine or diethylamine under nitrogen was heated to reflux temperature for 12-16 h . After cooling to room temperature $2.5-7 \mathrm{mmols}$ of enamine $\mathbf{5}$ in 1 mL of triethylamine were added and the reaction mixture was heated to reflux temperature for 16 h . After cooling to room temperature ( $4-8 \mathrm{mmols}$ ) of ammonium chloride ( $\mathbf{( 9 )}$ and 5 mL of acetic acid were added and the mixture was heated to reflux temperature for the time indicated. After cooling to room temperature, 40 mL of an aqueous solution of $\mathrm{K}_{2} \mathrm{CO}_{3}$ and 40 mL of ethylacetate were added. The aqueous layer was extracted several times with ethylacetate ( $4 \times 20 \mathrm{~mL}$ ). The combined organic phases were dried with magnesium sulfate and the solvents were removed in vacuo and the residue was chromatographed on silica gel (hexane/ethylacetate or n-heptane/ethylacetate 2:1) and/or
recrystallized from ethanol to give the analytically pure tetrahydronaphthyridines, dihydropyrindines and tetrahydroquinolines $\mathbf{1 0}$.

## 4-(4-Cyano-phenyl)-2-phenyl-7,8-dihydro-5H-[1,6]naphthyridine-6-carboxylic acid ethyl ester (10a)

According to the GP after work up, chromatography on silica gel (hexane/ethyl acetate, 4:1) and recrystallization from ethanol, $234 \mathrm{mg}(61 \%)$ of $\mathbf{1 0 a}$ were isolated as light yellow crystals. M.p. $189{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right), \delta 1.20-1.31(\mathrm{~m}, 3 \mathrm{H}), 3.19(\mathrm{t}, J=6.0 \mathrm{~Hz}$, $2 \mathrm{H}), 3.83(\mathrm{t}, J=6.1 \mathrm{~Hz}, 2 \mathrm{H}), 4.10(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 4.48(\mathrm{~s}, 2 \mathrm{H}), 7.38-7.49(\mathrm{~m}, 6 \mathrm{H})$, $7.77(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.96(\mathrm{dd}, J=1.5,8.2 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right), \delta 14.7$ $\left(\mathrm{CH}_{3}\right)$, $32.6\left(\mathrm{CH}_{2}\right), 41.4\left(\mathrm{CH}_{2}\right), 43.6\left(\mathrm{CH}_{2}\right), 61.7\left(\mathrm{CH}_{2}\right), 112.5\left(\mathrm{C}_{\text {quat. }}\right), 118.3\left(\mathrm{C}_{\text {quat. }}\right), 119.0$ $(\mathrm{CH}), 126.9(\mathrm{CH}), 128.8(\mathrm{CH}), 129.2(\mathrm{CH}), 129.2(\mathrm{CH}), 132.6(\mathrm{CH}), 138.6\left(\mathrm{C}_{\text {quat. }}\right), 142.8$ $\left(\mathrm{C}_{\text {quat. }}\right), 155.5\left(\mathrm{C}_{\text {quat. }}\right), 155.7\left(\mathrm{C}_{\text {quat. }}\right)$. MS (70 eV, EI): m/z (\%): $383\left(\mathrm{M}^{+}, 18\right), 354\left(\mathrm{M}^{+}\right.$ $\left.-\mathrm{CH}_{2} \mathrm{CH}_{3}, 100\right), 310\left(\mathrm{M}^{+}-\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}, 55\right)$. IR (KBr), $\tilde{v} 2984 \mathrm{~cm}^{-1}, 2225,1698,1591$, 1545, 1482, 1468, 1418, 1386, 1329, 1270, 1240, 1190, 1135, 1103, 1024, 846, 781, 697. UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right), \lambda_{\max }(\varepsilon) 254 \mathrm{~nm}$ (47900), 300 (12900). Anal. calcd. for $\mathrm{C}_{22} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{~S}$ (383.4): C 75.18, H 5.52, N 10.96; found C 74.91, H 5.53, N 10.83.

2-Phenyl-4-pyrimidin-2-yl-7,8-dihydro-5H-[1,6]naphthyridine-6-carboxylic acid ethyl ester (10b)

According to the GP after work up, chromatography on silica gel (hexane/ethyl acetate, 4:1) and recrystallization from ethanol, 206 mg ( $57 \%$ ) of $\mathbf{1 0 b}$ were isolated as yellow crystals.
M.p. $163{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right), \delta 1.18-1.23(\mathrm{~m}, 3 \mathrm{H}), 3.13(\mathrm{t}, J=6.0 \mathrm{~Hz}, 2 \mathrm{H})$, $3.78(\mathrm{t}, J=6.1 \mathrm{~Hz}, 2 \mathrm{H}), 4.05(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 5.00(\mathrm{~s}, 2 \mathrm{H}), 7.23(\mathrm{t}, J=4.9 \mathrm{~Hz}, 1 \mathrm{H})$, $7.29-7.41(\mathrm{~m}, 3 \mathrm{H}), 7.73(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.96(\mathrm{dt}, J=1.5,6.9 \mathrm{~Hz}, 2 \mathrm{H}), 8.16(\mathrm{~s}, 1 \mathrm{H})$, $8.80(\mathrm{~d}, J=4.9 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right), \delta 14.7\left(\mathrm{CH}_{3}\right), 33.0\left(\mathrm{CH}_{2}\right), 41.1\left(\mathrm{CH}_{2}\right)$, $44.6\left(\mathrm{CH}_{2}\right), 61.4\left(\mathrm{CH}_{2}\right), 119.4(\mathrm{CH}), 119.8(\mathrm{CH}), 125.7(\mathrm{CH}), 126.9(\mathrm{CH}), 128.6(\mathrm{CH}), 128.8$ $(\mathrm{CH}), 138.9\left(\mathrm{C}_{\text {quat. }}\right), 155.5$ ( $\mathrm{C}_{\text {quat. }}$ ), 155.5 ( $\mathrm{C}_{\text {quat. }}$ ), $157.1(\mathrm{CH}), 164.7\left(\mathrm{C}_{\text {quat. }}\right)$. MS (70 eV, EI): $m / z(\%): 360\left(\mathrm{M}^{+}, 92\right), 287\left(\mathrm{M}^{+}-\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}, 100\right), 260\left(\mathrm{M}^{+}, 58\right) . \mathrm{IR}(\mathrm{KBr}), \tilde{v} 2984 \mathrm{~cm}^{-1}$, 2939, 1685, 1589, 1542, 1468, 1437, 1415, 1385, 1306, 1287, 1274, 1169, 1105, 818, 782, 739, 704. UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right), \lambda_{\max }(\varepsilon) 250 \mathrm{~nm}$ (30900), 288 (6000), 312 (8100). Anal. calcd. for $\mathrm{C}_{21} \mathrm{H}_{20} \mathrm{~N}_{4} \mathrm{O}_{2}$ (360.4): C 69.98, H 5.59, N 15.55 ; found C 69.52, H 5.56, N 15.22 .

## 2-Phenyl-4-pyridin-2-yl-7,8-dihydro-5H-[1,6]naphthyridine-6-carboxylic acid ethyl ester

 (10c)

According to the GP after work up, chromatography on silica gel (hexane/ethyl acetate, 4:1), $148 \mathrm{mg}(41 \%)$ of $\mathbf{1 0 c}$ were isolated as a yellow oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right), \delta 1.20-1.26$ $(\mathrm{m}, 3 \mathrm{H}), 3.13(\mathrm{t}, J=6.0 \mathrm{~Hz}, 2 \mathrm{H}), 3.85(\mathrm{t}, J=6.1 \mathrm{~Hz}, 2 \mathrm{H}), 4.12(\mathrm{q}, J=7.0 \mathrm{~Hz}, 2 \mathrm{H}), 4.82$ ( $\mathrm{s}, 2 \mathrm{H}$ ), $7.42-7.51(\mathrm{~m}, 4 \mathrm{H}), 7.76(\mathrm{dd}, J=1.0,8.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.85(\mathrm{~s}, 1 \mathrm{H}), 7.97(\mathrm{dt}, J=1.8$, $8.0 \mathrm{~Hz}, 1 \mathrm{H}), 8.16-8.20(\mathrm{~m}, 2 \mathrm{H}), 8.74-8.76(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right), \delta 14.9$ $\left(\mathrm{CH}_{3}\right), 33.4\left(\mathrm{CH}_{2}\right), 42.0\left(\mathrm{CH}_{2}\right), 44.7\left(\mathrm{CH}_{2}\right), 61.7\left(\mathrm{CH}_{2}\right), 119.2(\mathrm{CH}), 124.1(\mathrm{CH}), 124.9(\mathrm{CH})$, $127.5(\mathrm{CH}), 129.4(\mathrm{CH}), 129.7(\mathrm{CH}), 138.0(\mathrm{CH}), 139.8\left(\mathrm{C}_{\text {quat. }}\right), 147.5\left(\mathrm{C}_{\text {quat. }}\right), 151.4(\mathrm{CH})$, 156.3 ( $\mathrm{C}_{\text {quat. }}$ ), 157.8 ( $\mathrm{C}_{\text {quat. }}$ ). IR (KBr), $\widetilde{v} 2980 \mathrm{~cm}^{-1}, 1696,1583,1547,1430,1384,1332$, 1271, 1239, 1203, 1172, 1144, 1107, 1048, 1024, 794, 774, 748, 696. UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right), \lambda_{\max }$ (ع) 254 nm (19100), 300 (9100), 366 (900). HRMS calcd. for $\mathrm{C}_{22} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{2}: 359.1634$; found 359.1645 .

## 2-Phenyl-4-(4-trifluoromethyl-phenyl)-7,8-dihydro-5H-[1,6]naphthyridine-6-carboxylic acid ethyl ester (10d)

According to the GP after work up, chromatography on silica gel (hexane/ethyl acetate, 4:1) and recrystallization from ethanol, $248 \mathrm{mg}(58 \%)$ of $\mathbf{1 0 d}$ were isolated as yellow crystals. M.p. $126^{\circ}{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right), \delta 1.22-1.25(\mathrm{~m}, 3 \mathrm{H}), 3.19(\mathrm{t}, J=6.1 \mathrm{~Hz}, 2 \mathrm{H})$, 3.84 (t, $J=6.1 \mathrm{~Hz}, 2 \mathrm{H}$ ), 4.11 (q, $J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 4.51$ (s, 2 H ), 7.38-7.49 (m, 6 H ), 7.73 (d, $J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.96-7.99(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right), \delta 14.7\left(\mathrm{CH}_{3}\right), 32.6\left(\mathrm{CH}_{2}\right)$, $41.4\left(\mathrm{CH}_{2}\right), 43.6\left(\mathrm{CH}_{2}\right), 61.6\left(\mathrm{CH}_{2}\right), 119.3(\mathrm{CH}), 119.0(\mathrm{CH}), 125.7(\mathrm{CH}), 125.8(\mathrm{CH}), 125.8$ $(\mathrm{CH}), 126.9(\mathrm{CH}), 128.7(\mathrm{CH}), 130.4(\mathrm{CH}), 130.9(\mathrm{CH}), 138.8\left(\mathrm{C}_{\text {quat. }}\right), 141.7\left(\mathrm{C}_{\text {quat. }}\right), 155.5$ ( $\mathrm{C}_{\text {quat. }}$ ), 155.5 ( $\mathrm{C}_{\text {quat. }}$ ), 155.7 ( $\mathrm{C}_{\text {quat. }}$ ). MS (70 eV, EI): m/z (\%): $426\left(\mathrm{M}^{+}, 10\right), 397\left(\mathrm{M}^{+}\right.$ $\left.-\mathrm{CH}_{2} \mathrm{CH}_{3}, 100\right), 353\left(\mathrm{M}^{+}-\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}, 30\right)$. IR (KBr), $\tilde{v} 2984 \mathrm{~cm}^{-1}, 1698,1592,1548$, 1469, 1431, 1387, 1326, 1284, 1270, 1243, 1198, 1169, 1129, 1108, 1065, 1019, 847, 778, 696. UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right), \lambda_{\max }(\varepsilon) 250 \mathrm{~nm}(22400), 288$ (10000), 298 (9500). Anal. calcd. for $\mathrm{C}_{24} \mathrm{H}_{21} \mathrm{~N}_{2} \mathrm{O}_{2}$ (426.4): C 67.60, H 4.96, N 6.57; found C 67.30, H 5.19, N 6.81.

## 2-Phenyl-4-pyrimidin-2-yl-6,7-dihydro-5H-[1]pyrindine (10e)

According to the GP after chromatography on silica gel (hexane/ethylacetate, 4:1) and recrystallization from ethanol 330 mg ( $59 \%$ ) of $\mathbf{1 0 e}$ were isolated as light brown crystals. M.p. $120{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right), \delta 2.09-2.20(\mathrm{~m}, 2 \mathrm{H}), 3.11(\mathrm{t}, J=7.8 \mathrm{~Hz}, 2 \mathrm{H})$,
$3.38(\mathrm{t}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.16(\mathrm{t}, J=4.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.25-7.47(\mathrm{~m}, 3 \mathrm{H}), 8.02-8.06(\mathrm{~m}, 2 \mathrm{H})$, $8.37(\mathrm{~s}, 1 \mathrm{H}), 8.79(\mathrm{~d}, J=4.8 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right), \delta 22.9\left(\mathrm{CH}_{2}\right), 32.0$ $\left(\mathrm{CH}_{2}\right), 34.1\left(\mathrm{CH}_{2}\right), 117.6(\mathrm{CH}), 119.3(\mathrm{CH}), 126.9(\mathrm{CH}), 127.1(\mathrm{CH}), 128.3(\mathrm{CH}), 128.4$ $(\mathrm{CH}), 128.5(\mathrm{CH}), 133.9\left(\mathrm{C}_{\text {quat. }}\right), 139.5\left(\mathrm{C}_{\text {quat. }}\right), 141.5\left(\mathrm{C}_{\text {quat. }}\right), 156.1\left(\mathrm{C}_{\text {quat. }}\right), 156.7(\mathrm{CH}), 156.8$ $(\mathrm{CH}), 164.4\left(\mathrm{C}_{\text {quat. }}\right), 167.6\left(\mathrm{C}_{\text {quat. }}\right)$. MS ( $70 \mathrm{eV}, \mathrm{EI}$ ): $m / z(\%): 273\left(\mathrm{M}^{+}, 100\right), 245\left(\mathrm{M}^{+}-\mathrm{C}_{2} \mathrm{H}_{4}\right.$, 5), $194\left(\mathrm{M}^{+}-\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N} 8\right)$. IR (KBr), $\tilde{v}=3063 \mathrm{~cm}^{-1}, 3040,2961,1592,1569,1548,1457,1424$, 1375, 1261, 1232, 1186, 1176, 1075, 818, 773, 696, 628. UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$, $\lambda_{\max }(\varepsilon) 250 \mathrm{~nm}$ (30900), 290 (5100), 342 (6600). Anal. calcd. for $\mathrm{C}_{18} \mathrm{H}_{15} \mathrm{~N}_{3}$ (273.3): C 79.10, H 5.53, N 15.37; found C 78.66, H 5.53, N 14.55 .

## 2-Phenyl-4-pyridin-2-yl-6,7-dihydro-5H-[1]pyrindine (10f)

According to the GP after chromatography on silica gel (hexane/ethylacetate, 4:1) and recrystallization from ethanol 344 mg ( $62 \%$ ) of $\mathbf{1 0 f}$ were isolated as light brown crystals. M.p. $93{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right), \delta 2.06-2.17(\mathrm{~m}, 2 \mathrm{H}), 3.10-3.17(\mathrm{~m}, 4 \mathrm{H})$, 7.22-7.44 (m, 4 H), 7.45-7.69 (m, 1 H ), $7.70(\mathrm{dt}, J=1.8,7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.87(\mathrm{~s}, 1 \mathrm{H})$, 8.00-8.03 (m, 2 H ), 8.70-8.72 (m, 1 H$).{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right), \delta 23.2\left(\mathrm{CH}_{2}\right), 30.9$ $\left(\mathrm{CH}_{2}\right), 34.3\left(\mathrm{CH}_{2}\right), 117.3(\mathrm{CH}), 122.7(\mathrm{CH}), 122.8(\mathrm{CH}), 126.8(\mathrm{CH}), 128.3(\mathrm{CH}), 128.4(\mathrm{CH})$, $133.2\left(\mathrm{C}_{\text {quat }}\right), 136.3(\mathrm{CH}), 139.6\left(\mathrm{C}_{\text {quat }}\right), 143.8\left(\mathrm{C}_{\text {quat }}\right), 149.5(\mathrm{CH}), 156.24\left(\mathrm{C}_{\text {quat }}\right), 156.28$ $\left(\mathrm{C}_{\text {quat }}\right), 167.0\left(\mathrm{C}_{\text {quat. }}\right)$. MS (70 eV, EI): $m / z(\%): 272.1\left(\mathrm{M}^{+}, 100\right), 217.1\left(\mathrm{M}^{+}-\mathrm{C}_{3} \mathrm{H}_{6} \mathrm{~N} 10\right)$, $167.1\left(\mathrm{M}^{+}-\mathrm{C}_{5} \mathrm{H}_{6} \mathrm{~N} 12\right)$. IR (KBr), $\tilde{v} 3060 \mathrm{~cm}^{-1}, 2957,2927,1587,1577,1556,1476,1458$, 1434, 1423, 1376, 1231, 992, 879, 793, 778, 748, 733, 696. UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right), \lambda_{\max }(\varepsilon) 248 \mathrm{~nm}$ (24000), 266 (21900), 310 (8300). Anal. calcd. for $\mathrm{C}_{19} \mathrm{H}_{16} \mathrm{~N}_{2}$ (272.4): C 83.79, H 5.90, N 10.29; found C 83.31, H 6.10, N 10.06.

## 2-Phenyl-4-(4-trifluoromethyl-phenyl)-6,7-dihydro-5H-[1]pyrindine (10g)

According to the GP after chromatography on silica gel (hexane/ethylacetate, 4:1) and recrystallization from ethanol, $368 \mathrm{mg}(54 \%)$ of $\mathbf{1 0 g}$ were isolated as light-brown crystals. M.p. ${ }^{115-118 ~}{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right), \delta 2.12-2.22(\mathrm{~m}, 2 \mathrm{H}), 3.01(\mathrm{t}, J=7.3 \mathrm{~Hz}, 2$ H), 3.17 (t, $J=7.6 \mathrm{~Hz}, 2 \mathrm{H}$ ), 7.37-7.5 (m, 3 H ), 7.50 ( $\mathrm{s}, 1 \mathrm{H}$ ), 7.62-7.76 (m, 4 H ), 7.97-7.99 $(\mathrm{m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right), \delta 23.5\left(\mathrm{CH}_{2}\right), 30.4\left(\mathrm{CH}_{2}\right), 34.6\left(\mathrm{CH}_{2}\right), 118.0(\mathrm{CH})$, $122.2(\mathrm{CH}), 125.6(\mathrm{CH}), 125.5(\mathrm{CH}), 125.6(\mathrm{CH}), 125.8\left(\mathrm{C}_{\text {quat. }}\right), 133.2\left(\mathrm{C}_{\text {quat. }}\right), 139.3\left(\mathrm{C}_{\text {quat. }}\right)$, $142.5\left(\mathrm{C}_{\text {quat. }}\right), 144.7\left(\mathrm{C}_{\text {quat. }}\right), 156.6\left(\mathrm{C}_{\text {quat. }}\right), 166.9\left(\mathrm{C}_{\text {quat. }}\right) . \mathrm{MS}(70 \mathrm{eV}, \mathrm{EI}): m / z(\%): 339\left(\mathrm{M}^{+}\right.$, $65), 338\left(\mathrm{M}^{+}-\mathrm{H}, 100\right), 320\left(\mathrm{M}^{+}-\mathrm{F}, 7\right), 270\left(\mathrm{M}^{+},-\mathrm{F},-\mathrm{HF}, 7\right) . \mathrm{IR}(\mathrm{KBr}), \tilde{v}=3058 \mathrm{~cm}^{-1}$, 2993,2974, 2954, 2885, 2836, 1619, 1592, 1576, 1560, 1438, 1425, 1412, 1373, 1324, 1160, 1134, 1126, 1109, 1065, 1016, 846, 776, 695. UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$, $\lambda_{\max }(\varepsilon) 254 \mathrm{~nm}(30900), 306$ (8700). Anal. calcd. for $\mathrm{C}_{21} \mathrm{H}_{16} \mathrm{~F}_{3} \mathrm{~N}$ (339.4): C 74.33, H 4.75, N 4.13; found C 74.08, H 4.45, N 4.25 .

## 4-(2-Phenyl-6,7-dihydro-5H-[1]pyrindin-4-yl)-benzoic acid ethyl ester (10h)

According to the GP after chromatography on silica gel (hexane/ethylacetate, 4:1) and recrystallization from ethanol 296 mg ( $42 \%$ ) of $\mathbf{1 0 h}$ were isolated as light yellow crystals. M.p. $95-96{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right), \delta 1.42(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}), 2.15(\mathrm{~m}, 2 \mathrm{H}), 3.03$
$(\mathrm{t}, J=7.3 \mathrm{~Hz}, 2 \mathrm{H}), 3.16(\mathrm{t}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}) 4.4(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.32-7.48(\mathrm{~m}, 3 \mathrm{H}), 7.51$ (s, 1 H ), 7.56 (dt, $J=1.8,8.6 \mathrm{~Hz}, 2 \mathrm{H}$ ), $7.96-7.98(\mathrm{~m}, 2 \mathrm{H}), 8.13(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H})$. ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right), \delta 14.3\left(\mathrm{CH}_{3}\right), 23.5\left(\mathrm{CH}_{2}\right), 30.5\left(\mathrm{CH}_{2}\right), 34.7\left(\mathrm{CH}_{2}\right), 61.1\left(\mathrm{CH}_{2}\right)$, $117.9(\mathrm{CH}), 127.0(\mathrm{CH}), 128.1(\mathrm{CH}), 128.6(\mathrm{CH}), 128.7(\mathrm{CH}), 129.8(\mathrm{CH}), 130.2\left(\mathrm{C}_{\text {quat. }}\right)$, $133.1\left(\mathrm{C}_{\text {quat. }}\right), 139.5\left(\mathrm{C}_{\text {quat. }}\right), 143.3\left(\mathrm{C}_{\text {quat. }}\right), 144.9\left(\mathrm{C}_{\text {quat. }}\right), 156.5\left(\mathrm{C}_{\text {quat. }}\right), 166.2\left(\mathrm{C}_{\text {quat. }}\right), 166.8$ (C quat. ). MS (70 eV, EI): $m / z(\%): 343\left(\mathrm{M}^{+}, 100\right), 342\left(\mathrm{M}^{+}-\mathrm{H}, 70\right), 314\left(\mathrm{M}^{+}-\mathrm{C}_{2} \mathrm{H}_{5}, 38\right)$. IR (KBr), $\tilde{v} 2975 \mathrm{~cm}^{-1}, 1715,1610,1591,1577,1554,1458,1440,1424,1367,1311,1274$, 1182, 1106, 1021, 859, 776, 708, 698. UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right), \lambda_{\text {max }}(\varepsilon) 262 \mathrm{~nm}(34700), 308$ (7800). Anal. calcd. for $\mathrm{C}_{23} \mathrm{H}_{21} \mathrm{NO}_{2}$ (343.4): C 80.44, H 6.16, N 4.08; found C 80.11, H 6.19, N 4.08.

## 4-(2-Phenyl-5,6,7,8-tetrahydroquinolin-4-yl)-benzonitrile (10i)

According to the GP after chromatography on silica gel (cyclohexane/ethylacetate 1:1) and recrystallization from ethanol $432 \mathrm{mg}(70 \%)$ of analytically pure $\mathbf{1 0 i}$ were isolated as colorless crystals. M.p. $194-195{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right), \delta 1.77(\mathrm{~m}, J=7.0 \mathrm{~Hz}, 2$ H), $1.95(\mathrm{~m}, J=6.0 \mathrm{~Hz}, 2 \mathrm{H}), 2.59(\mathrm{t}, J=6.4 \mathrm{~Hz}, 2 \mathrm{H}), 3.10(\mathrm{t}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.26(\mathrm{~s}, 1 \mathrm{H})$, $7.34-7.50(\mathrm{~m}, 5 \mathrm{H}), 7.75(\mathrm{dd}, J=8.6 \mathrm{~Hz}, J=2.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.96(\mathrm{dd}, J=8.0 \mathrm{~Hz}, J=1.8 \mathrm{~Hz}, 2$ H). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right), \delta 22.8\left(\mathrm{CH}_{2}\right), 22.9\left(\mathrm{CH}_{2}\right), 27.1\left(\mathrm{CH}_{2}\right), 33.2\left(\mathrm{CH}_{2}\right), 111.7$ $\left(\mathrm{C}_{\text {quat. }}\right), 118.3(\mathrm{CH}), 118.5\left(\mathrm{C}_{\text {quat. }}\right), 126.8(\mathrm{CH}), 127.8\left(\mathrm{C}_{\text {quat. }}\right), 128.7(\mathrm{CH}), 128.7(\mathrm{CH}), 129.4$ $(\mathrm{CH}), 132.2(\mathrm{CH}), 139.2\left(\mathrm{C}_{\text {quat. }}\right), 144.5\left(\mathrm{C}_{\text {quat. }}\right), 148.2\left(\mathrm{C}_{\text {quat. }}\right), 154.6\left(\mathrm{C}_{\text {quat. }}\right), 158.1\left(\mathrm{C}_{\text {quat. }}\right)$. MS (70 eV, EI): m/z (\%): 310 ( $\mathrm{M}^{+}, 92$ ), $309\left(\mathrm{M}^{+}-\mathrm{H}, 100\right)$. IR (KBr), $\widetilde{v} 2934 \mathrm{~cm}^{-1}, 2224(\mathrm{C} \equiv \mathrm{N})$, 1590, 1537, 1442, 1433, 1381, 901, 843, 774, 691, 590. Anal. calcd. for $\mathrm{C}_{22} \mathrm{H}_{18} \mathrm{~N}_{2}$ (310.4): C 85.13, H 5.85, N 9.02; found C 84.80, H 5.87, N 8.94 .

## 2-Phenyl-4-pyrimidin-2-yl-5,6,7,8-tetrahydro-quinoline (10j)

According to the GP after chromatography on silica gel (hexane/ethylacetate, 4:1) and recrystallization from ethanol $290 \mathrm{mg}(50 \%)$ of $\mathbf{1 0 j}$ were isolated as light brown crystals. M.p. $120^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right), \delta 1.33-1.82(\mathrm{~m}, 2 \mathrm{H}), 1.90-2.16(\mathrm{~m}, 2 \mathrm{H}), 2.94(\mathrm{t}$, $J=6.4 \mathrm{~Hz}, 2 \mathrm{H}), 3.11(\mathrm{t}, J=6.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.26(\mathrm{t}, J=4.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.32-7.46(\mathrm{~m}, 3 \mathrm{H}), 7.84$ $(\mathrm{s}, 1 \mathrm{H}), 7.98-8.02(\mathrm{~m}, 2 \mathrm{H}), 8.85(\mathrm{~d}, J 4.8 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right), \delta 22.6$ $\left(\mathrm{CH}_{2}\right), 22.7\left(\mathrm{CH}_{2}\right), 26.7\left(\mathrm{CH}_{2}\right), 33.3\left(\mathrm{CH}_{2}\right), 118.8(\mathrm{CH}), 119.3(\mathrm{CH}), 126.7(\mathrm{CH}), 128.3(\mathrm{CH})$, 128.9 (CH), 129.1 ( $\mathrm{C}_{\text {quat. }}$ ), 139.3 ( $\left.\mathrm{C}_{\text {quat. }}\right), 145.8$ ( $\mathrm{C}_{\text {quat. }}$ ), 154.3 ( $\left.\mathrm{C}_{\text {quat. }}\right), 156.8(\mathrm{CH}), 158.2$ ( $\mathrm{C}_{\text {quat. }}$ ), $166.1\left(\mathrm{C}_{\text {quat. }}\right)$. MS (70 eV, EI): $m / z(\%): 287\left(\mathrm{M}^{+}, 100\right), 272\left(\mathrm{M}^{+}-\mathrm{CH}_{3}, 32\right), 259\left(\mathrm{M}^{+}\right.$ - $\mathrm{C}_{2} \mathrm{H}_{4}, 12$ ). IR (KBr), $\widetilde{v} 3050 \mathrm{~cm}^{-1}, 2939,2915,2878,2857,1592,1564,1543,1456,1440$, $1419,1378,1228,845,831,771,736,694,633$. UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right), \lambda_{\max }(\varepsilon) 250 \mathrm{~nm}(26300)$, 286 (7100), 308 (7600). ## 2-(2,6-Diphenyl-pyridin-4-yl)-pyrimidine (10n)

According to the GP after chromatography on silica gel (hexane/ethylacetate, 1:1) and recrystallization from ethanol, $211 \mathrm{mg}(68 \%)$ of $\mathbf{1 0 n}$ were isolated as light-brown crystals. M.p. $224{ }^{\circ} \mathrm{C}$. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right), \delta 7.32(\mathrm{t}, J=4.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.42-7.56(\mathrm{~m}, 6 \mathrm{H})$, 8.29-8.32 (m, 4 H ), $8.75(\mathrm{~s}, 2 \mathrm{H}), 8.90(\mathrm{~d}, J=4.89,2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right), \delta 116.9$ $(\mathrm{CH}), 120.3(\mathrm{CH}), 127.0(\mathrm{CH}), 128.5(\mathrm{CH}), 128.9(\mathrm{CH}), 129.1(\mathrm{CH}), 139.2\left(\mathrm{C}_{\text {quat. }}\right), 146.2$
( $\mathrm{C}_{\text {quat. }}$ ), $157.2(\mathrm{CH}), 157.5\left(\mathrm{C}_{\text {quat. }}\right), 163.0\left(\mathrm{C}_{\text {quat. }}\right)$. $\mathrm{MS}(70 \mathrm{eV}, \mathrm{EI}): \mathrm{m} / \mathrm{z}(\%): 309\left(\mathrm{M}^{+}, 68\right), 77$ $\left(\mathrm{C}_{6} \mathrm{H}_{5}^{+}, 100\right)$. IR (KBr), $\widetilde{v} 3038 \mathrm{~cm}^{-1}, 1602,1580,1565,1549,1462,1449,1424,1399,1233$, 896, 811, 772, 732, 691, 669, 640, 629, 618. UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right), \lambda_{\max }(\varepsilon) 248 \mathrm{~nm}(79400), 270$ (38000), 332 (11200). Anal. calcd. for $\mathrm{C}_{21} \mathrm{H}_{15} \mathrm{~N}_{3}$ (309.4): C 81.53, H 4.89, N 13.58; found C 81.30, H 4.84, N 13.23.

## 2-[2-(4-Methoxy-phenyl)-6-phenyl-pyridin-4-yl]-pyrimidine (100)

According to the GP after work up, chromatography on silica gel (hexane/ethyl acetate, 1:1) and recrystallization from ethanol, 132 mg ( $39 \%$ ) of $\mathbf{1 0 0}$ were isolated as yellow crystals. M.p. $144{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right), \delta 3.87(\mathrm{~s}, 3 \mathrm{H}), 7.02(\mathrm{dt}, J=1.5,5.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.29$ (t, $J=2.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.43-7.52(\mathrm{~m}, 3 \mathrm{H}), 8.24-8.28(\mathrm{~m}, 4 \mathrm{H}), 8.52(\mathrm{~s}, 1 \mathrm{H}), 8.53(\mathrm{~s}, 1 \mathrm{H}), 8.87$ (d, $J=2.9 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right), \delta 55.3\left(\mathrm{OCH}_{3}\right), 114.0(\mathrm{CH}), 116.3(\mathrm{CH})$, $116.3(\mathrm{CH}), 120.5(\mathrm{CH}), 127.1(\mathrm{CH}), 128.4(\mathrm{CH}), 128.6(\mathrm{CH}), 129.0(\mathrm{CH}), 132.0\left(\mathrm{C}_{\text {quat. }}\right)$, 139.5 ( $\mathrm{C}_{\text {quat. }}$ ), 146.3 ( $\mathrm{C}_{\text {quat. }}$ ), $157.3\left(\mathrm{C}_{\text {quat. }}\right)$, $157.4\left(\mathrm{C}_{\text {quat. }}\right), 157.4\left(\mathrm{C}_{\text {quat. }}\right)$, 160.6 ( $\left.\mathrm{C}_{\text {quat. }}\right), 163.2$ ( $\mathrm{C}_{\text {quat. }}$ ). MS (70 eV, EI): $m / z(\%): 339\left(\mathrm{M}^{+}, 100\right), 324\left(\mathrm{M}^{+}-\mathrm{CH}_{3}, 20\right), 296\left(\mathrm{M}^{+}, 18\right)$. IR (KBr), $\widetilde{v} 3043 \mathrm{~cm}^{-1}, 2831,1606,1580,1566,1547,1515,1457,1434,1419,1400,1305,1251$, 1232, 1176, 1031, 835, 807, 773, 696, 640. UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$, $\lambda_{\text {max }}(\varepsilon) 282$ (20900), 344 (8300). Anal. calcd. for $\mathrm{C}_{20} \mathrm{H}_{17} \mathrm{~N}_{3} \mathrm{O}$ (339.4): C 77.88, H 5.01, N 12.39 ; found C 77.66, H 5.08, N 12.27.

### 6.4 General Procedure for the One-Pot Coupling-Isomerization-Enamino Ester-Cyclocondensation Synthesis of Dihydropyrines 12 and Pyridines 13

A magnetically stirred solution of 1.0 mmol of halogen compound $\mathbf{1}, 1.05 \mathrm{mmols}$ of propargyl alcohol 2a, 0.02 mmols of $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right) \mathrm{Cl}_{2}$, and 0.01 mmols of CuI in 4 mL of degassed triethylamine or diethylamine under nitrogen was heated to reflux temperature for 12 h (for experimental details see Table 7). After cooling at room temperature solution of 2.0 mmols of ethyl 3-amino crotonate (11) in 1 mL of triethylamine or diethylamine and 2 mL of acetic acid were added and the reaction mixture was heated to reflux temperature for 24 h . After cooling to room temperature 40 mL of ethyl acetate and 40 mL of water were added and stirring was continued for 5 to 10 min . The aqueous layer was extracted with ethyl acetate ( $4 \times 15 \mathrm{~mL}$ ) and the combined organic phase was dried with magnesium sulfate. After filtration the solvents were removed in vacuo and the residue was chromatographed on silica gel (hexane/ethyl acetate $4: 1$ or $1: 1$ ) and recrystallized from ethanol or pentane/chloroform (1:1) to give the analytically pure dihydropyridine (12) and pyridine derivatives (13).

Table 27 Experimental Details for the One-Pot Three-Component Synthesis of Dihydropyridines 12 and Pyridines 13.

## Ethyl 4-(4-cyanophenyl)-2-methyl-6-phenyl-1,4-dihydropyridine-3-carboxylate (12a)

According to the GP after chromatography on silica gel (hexane/ethylacetate, 4:1) 155 mg ( $45 \%$ ) of 12a were isolated as yellow crystals. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right), \delta 1.01(\mathrm{t}, J=$ $7 \mathrm{~Hz}, 3 \mathrm{H}), 2.34$ (s, 3 H ), $3.89-3.98$ (m, 2 H ), 4.66 (d, $J=5.5 \mathrm{~Hz}, 1 \mathrm{H}$ ), $5.00(\mathrm{dd}, J=2,5.3$ $\mathrm{Hz}, 1 \mathrm{H}), 5.78(\mathrm{~s}, 1 \mathrm{H}), 7.18-7.35(\mathrm{~m}, 7 \mathrm{H}), 7.45-7.48(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right)$, $\delta 14.5\left(\mathrm{CH}_{3}\right), 19.7\left(\mathrm{CH}_{3}\right), 41.6(\mathrm{CH}), 59.5\left(\mathrm{CH}_{2}\right), 97.5\left(\mathrm{C}_{\text {quat. }}\right), 103.9(\mathrm{CH}), 110.1\left(\mathrm{C}_{\text {quat. }}\right)$, $119.7\left(\mathrm{C}_{\text {quat. }}\right)$, $126.3(\mathrm{CH}), 127.1(\mathrm{CH}), 129.2(\mathrm{CH}), 132.9(\mathrm{CH}), 133.2(\mathrm{CH}), 136.2\left(\mathrm{C}_{\text {quat. }}\right)$, $136.6\left(\mathrm{C}_{\text {quat. }}\right), 150.2\left(\mathrm{C}_{\text {quat. }}\right), 151.3\left(\mathrm{C}_{\text {quat. }}\right), 155.5\left(\mathrm{C}_{\text {quat. }}\right), 168.3\left(\mathrm{C}_{\text {quat. }}\right) . \mathrm{MS}(70 \mathrm{eV}, \mathrm{EI}): \mathrm{m} / \mathrm{z}$ (\%): $344.2\left(\mathrm{M}^{+}, 15\right), 315.1\left(\mathrm{M}^{+}-\mathrm{C}_{2} \mathrm{H}_{5}, 36\right), 271.2\left(\mathrm{M}^{+}-\mathrm{CO}_{2} \mathrm{C}_{2} \mathrm{H}_{5}, 20\right), 242.2\left(\mathrm{M}^{+}-\mathrm{C}_{7} \mathrm{H}_{4} \mathrm{~N}\right.$, 100).

## Ethyl 2-methyl-6-phenyl-4-(4-(trifluoromethyl)phenyl)-1,4-dihydropyridine-3-

 carboxylate (12b)

According to the GP after chromatography on silica gel (hexane/ethylacetate, 5:1) 268 mg $(37 \%)$ of $\mathbf{1 2 b}$ were isolated as yellow crystals. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right), \delta 1.01(\mathrm{t}, J=7$ $\mathrm{Hz}, 3 \mathrm{H}$ ), $2.30(\mathrm{~s}, 3 \mathrm{H}), 3.86-3.94(\mathrm{~m}, 2 \mathrm{H}), 4.64(\mathrm{~d}, J=5.25 \mathrm{~Hz}, 1 \mathrm{H}), 5.00(\mathrm{dd}, J=1.75$,
$5.25 \mathrm{~Hz}, 1 \mathrm{H}), 5.65(\mathrm{~s}, 1 \mathrm{H}), 7.20-7.33(\mathrm{~m}, 7 \mathrm{H}), 7.40(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right.$, $75 \mathrm{MHz}), \delta 14.1\left(\mathrm{CH}_{3}\right), 20.6\left(\mathrm{CH}_{3}\right), 41.0(\mathrm{CH}), 59.3\left(\mathrm{CH}_{2}\right), 98.4\left(\mathrm{C}_{\text {quat. }}\right)$, $104.1(\mathrm{CH}), 125.1$ $(\mathrm{CH}), 128.3(\mathrm{CH}), 128.7(\mathrm{CH}), 134.9\left(\mathrm{C}_{\text {quat. }}\right), 147.4\left(\mathrm{C}_{\text {quat. }}\right), 152.7\left(\mathrm{C}_{\text {quat. }}\right), 168.0\left(\mathrm{C}_{\text {quat. }}\right)$. MS (70eV, EI): m/z (\%): $387.1\left(\mathrm{M}^{+}, 15\right), 358.1\left(\mathrm{M}^{+}-\mathrm{C}_{2} \mathrm{H}_{5}, 18\right), 314.1\left(\mathrm{M}^{+}-\mathrm{CO}_{2} \mathrm{C}_{2} \mathrm{H}_{5}, 25\right), 242.1$ $\left(\mathrm{M}^{+}-\mathrm{C}_{7} \mathrm{H}_{4} \mathrm{~F}_{3}, 100\right)$. HRMS calcd. for $\left(\mathrm{C}_{22} \mathrm{H}_{20} \mathrm{~F}_{3} \mathrm{NO}_{2}\right)$ : 387.1446; found 387.1453.

## 4-(4-Cyano-phenyl)-2-methyl-6-phenyl-nicotinic acid ethyl ester (13a)

According to the GP after chromatography on silica gel (hexane/ethylacetate, 4:1) and recrystallization from ethanol, $137 \mathrm{mg}(40 \%)$ of 13a were isolated as light-brown crystals. M.p. $131{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right), \delta 1.01(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}), 2.73(\mathrm{~s}, 1 \mathrm{H}), 4.09(\mathrm{q}, J$ $=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.43-7.53(\mathrm{~m}, 6 \mathrm{H}), 7.72-7.75(\mathrm{~m}, 2 \mathrm{H}), 8.00-8.03(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right), \delta 13.7\left(\mathrm{CH}_{3}\right), 23.2\left(\mathrm{CH}_{3}\right), 61.5\left(\mathrm{CH}_{2}\right), 112.4\left(\mathrm{C}_{\text {quat. }}\right), 117.9(\mathrm{CH}), 118.3$ $\left(\mathrm{C}_{\text {quat. }}\right)$, $126.1\left(\mathrm{C}_{\text {quat. }}\right)$, $127.1(\mathrm{CH}), 128.7(\mathrm{CH}), 128.8(\mathrm{CH}), 129.6(\mathrm{CH}), 132.1(\mathrm{CH}), 132.2$ $(\mathrm{CH}), 138.2\left(\mathrm{C}_{\text {quat. }}\right), 143.6\left(\mathrm{C}_{\text {quat. }}\right)$, $147.1\left(\mathrm{C}_{\text {quat. }}\right), 156.3\left(\mathrm{C}_{\text {quat. }}\right), 157.7\left(\mathrm{C}_{\text {quat. }}\right)$, 168.1 ( $\left.\mathrm{C}_{\text {quat. }}\right)$. MS (70eV, EI): m/z (\%): $342\left(\mathrm{M}^{+}, 100\right), 313\left(\mathrm{M}^{+}-\mathrm{C}_{2} \mathrm{H}_{5}, 60\right), 297\left(\mathrm{M}^{+}-\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{O}, 76\right)$. IR (KBr), $\tilde{v} 3060 \mathrm{~cm}^{-1}, 2993,2229,1722,1588,1567,1540,1500,1380,1361,1280,1265$, 1243, 1184, 1148, 1097, 1078, 850, 772, 695, 587. UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right), \lambda_{\text {max }}(\varepsilon) 256$ (35500), 298 (12000). Anal. calcd. for $\mathrm{C}_{22} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{2}$ (342.4): C 77.17, H 5.30, N 8.18; found C 76.84, H 5.33, N 8.12.

## 2-Methyl-6-phenyl-4-pyrimidin-2-yl-nicotinic acid ethyl ester (13b)

According to the GP after chromatography on silica gel (hexane/ethylacetate, 1:1) and recrystallization from ethanol, $154 \mathrm{mg}(50 \%)$ of $\mathbf{1 3 b}$ were isolated as light-brown crystals. M.p. $115-118{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}, 300 \mathrm{MHz}$ ), $\delta 1.27-1.35(\mathrm{~m}, 3 \mathrm{H}), 2.77(\mathrm{~s}, 3 \mathrm{H}), 4.36(\mathrm{q}, J$ $=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.28(\mathrm{t}, J=4.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.44-7.53(\mathrm{~m}, 3 \mathrm{H}), 8.13-8.15(\mathrm{~m}, 2 \mathrm{H}), 8.49(\mathrm{~s}, 1$ H), $8.83(\mathrm{~d}, J=4.9 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right), \delta 13.9\left(\mathrm{CH}_{3}\right), 22.8\left(\mathrm{CH}_{3}\right), 61.2$ $\left(\mathrm{CH}_{2}\right), 117.3(\mathrm{CH}), 120.2(\mathrm{CH}), 126.5\left(\mathrm{C}_{\text {quat. }}\right), 127.0(\mathrm{CH}), 127.1(\mathrm{CH}), 128.6(\mathrm{CH}), 129.3$ $(\mathrm{CH}), 138.5\left(\mathrm{C}_{\text {quat. }}\right), 143.8\left(\mathrm{C}_{\text {quat. }}\right), 156.1\left(\mathrm{C}_{\text {quat. }}\right), 156.9(\mathrm{CH}), 157.6\left(\mathrm{C}_{\text {quat. }}\right), 162.9\left(\mathrm{C}_{\text {quat. }}\right)$, 169.3 ( $\mathrm{C}_{\text {quat. }}$ ). MS (70eV, EI): m/z (\%): 319 ( $\mathrm{M}^{+}, 93$ ), $274\left(\mathrm{M}^{+}-\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{O}, 100\right), 246\left(\mathrm{M}^{+}-\right.$ $\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}_{2}, 36$ ). IR (KBr), $\tilde{v} 2975 \mathrm{~cm}^{-1}, 1715,1585,1565,1550,1457,1424,1386,1369,1274$, $1175,1158,1110,1075,1010,837,813,760$, 696. UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right), \lambda_{\max }(\varepsilon) 250 \mathrm{~nm}$ (28200), 314 (10200). Anal. calcd. for $\mathrm{C}_{19} \mathrm{H}_{17} \mathrm{~N}_{3} \mathrm{O}_{2}$ (319.4): C 71.46, H 5.37, N 13.16 ; found C 71.28, H 5.35, N 13.08.

## Etyl 2-methyl-6-phenyl-4-(thiazol-2-yl)nicotinate (13c)

According to the GP after chromatography on silica gel (hexane/ethylacetate, $5: 1$ ) 85 mg $(26 \%)$ of $\mathbf{1 4 c}$ were isolated as yellow crystals. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right), \delta 1.30(\mathrm{t}, J=7$ Hz, 3 H ), 2.90 ( $\mathrm{s}, 3 \mathrm{H}$ ), 4.36 (q, $J=7 \mathrm{~Hz} 2 \mathrm{H}$ ), 7.4 (d, $J=3.25 \mathrm{~Hz}, 1 \mathrm{H}), 7.47-7.51$ (m, 3 H ), $7.88(\mathrm{~s}, 1 \mathrm{H}), 7.94(\mathrm{~d}, J=3.25 \mathrm{~Hz}, 1 \mathrm{H}), 8.03-8.06(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right)$,
$\delta 14.1\left(\mathrm{CH}_{3}\right)$, $22.9\left(\mathrm{CH}_{3}\right), 62.1\left(\mathrm{CH}_{2}\right), 117.2(\mathrm{CH}), 122.6(\mathrm{CH}), 123.1(\mathrm{CH}), 126.1\left(\mathrm{C}_{\text {quat. }}\right)$, $127.9(\mathrm{CH}), 129.6(\mathrm{CH}), 130.5(\mathrm{CH}), 138.8\left(\mathrm{C}_{\text {quat. }}\right), 139.9\left(\mathrm{C}_{\text {quat. }}\right), 144.9(\mathrm{CH}), 156.8\left(\mathrm{C}_{\text {quat. }}\right)$, $158.2\left(\mathrm{C}_{\text {quat. }}\right), 164.4\left(\mathrm{C}_{\text {quat. }}\right), 168.7\left(\mathrm{C}_{\text {quat. }}\right) . \mathrm{MS}(70 \mathrm{eV}, \mathrm{EI}): m / z(\%)=324.0\left(\mathrm{M}^{+}, 38\right), 295.0$ $\left(\mathrm{M}^{+}-\mathrm{C}_{2} \mathrm{H}_{5}, 10\right), 279.1\left(\mathrm{M}^{+}-\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{O}, 36\right) .387 .1446$.

## 2'-Methyl-6'-phenyl-1'-4'-dihydro-[2,4']bipyridinyl-3'-carboxilyc acid ethyl ester (13d)

According to the GP after chromatography on silica gel (hexane/ethylacetate, 1:1) and recrystallization from ethanol, $83 \mathrm{mg}(26 \%)$ of $\mathbf{1 3 d}$ were isolated as a brown oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 3000 \mathrm{MHz}\right), \delta 1.03(\mathrm{t}, J=7 \mathrm{~Hz}, 3 \mathrm{H}), 2.68(\mathrm{~s}, 3 \mathrm{H}), 4.12(\mathrm{q}, J=7 \mathrm{~Hz}, 2 \mathrm{H})$, 7.23-7.28 (m, 1 H), 7.35-7.45 (m, 3 H ), 7.57 (d, $J=8 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.70-7.77 (m, 2 H ), 7.96$8.00(\mathrm{~m}, 2 \mathrm{H}), 8.59-8.61(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right), \delta 13.7\left(\mathrm{CH}_{3}\right), 23.1\left(\mathrm{CH}_{3}\right)$, $61.2\left(\mathrm{CH}_{2}\right), 117.3(\mathrm{CH}), 122.3(\mathrm{CH}), 122.3(\mathrm{CH}), 123.3(\mathrm{CH}), 127.4\left(\mathrm{C}_{\text {quat }}\right), 128.7(\mathrm{CH})$, $136.8(\mathrm{CH}), 138.7\left(\mathrm{C}_{\text {quat }}\right), 147.0\left(\mathrm{C}_{\text {quat }}\right), 149.3(\mathrm{CH}), 156.0\left(\mathrm{C}_{\text {quat }}\right), 156.5\left(\mathrm{C}_{\text {quat }}\right), 157.6\left(\mathrm{C}_{\text {quat }}\right)$, $169.0\left(\mathrm{C}_{\text {quat }}\right)$. IR (KBr), $\tilde{v} 3060 \mathrm{~cm}^{-1}, 2980,2930,2902,2860,1952,1728,1585,1549,1474$, 1434, 1383, 1364, 1344, 1269, 1183, 1153, 1106, 1028, 994, 859, 797, 768, 695. UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right), \lambda_{\max }(\varepsilon): 252 \mathrm{~nm}(19500), 304$ (9300). HRMS calcd. for $\mathrm{C}_{20} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{2}: 318.1368$; found 318.1367.

### 6.5 General Procedure for $N$-[1-(Hetero)aryl-prop-2-ynyl] tosyl Amides 18

To 1.3 equiv. of a 0.5 M solution of ethynyl magnesium bromide in THF at $0{ }^{\circ} \mathrm{C}$ (icewater) 1.0 eq. of a solution of the corresponding azomethine 16 in THF ( $1.25 \mathrm{mmols} / \mathrm{mL}$ ) was added dropwise within 15 min . After stirring of the suspension for 15 min at $0^{\circ} \mathrm{C}$ the reaction mixture was stirred for 1 h at room temperature. After the reaction was complete according to TLC monitoring 120 mL of a saturated aqueous solution of $\mathrm{NH}_{4} \mathrm{Cl}$ was added to the reaction mixture and the aqueous phase was extracted three times with diethylether $(3 \times 100 \mathrm{~mL})$. The
combined organic layers were dried with anhydrous magnesium sulfate and after evaporation sufficiently pure (according to ${ }^{1} \mathrm{H}$ NMR spectra) $N$-[1-(hetero)aryl-prop-2-ynyl] tosyl amide $\mathbf{1 8}$ was isolated such that it could be recrystallized from ethanol in case of impurities.

## $N$-[1-(4-Methoxyphenyl)-prop-2-ynyl]-4-methyl-benzenesulfonamide (18a)

According to the GP from the reaction of 10.1 g ( 34.5 mmols ) of N -(4-methoxybenzylidene)-4-methyl-benzenesulfonamide (16a) and $102 \mathrm{ml}(52 \mathrm{mmols})$ of a 0.5 M solution of ethynyl magnesium bromide in 45 ml of THF, 7.3 g ( $89 \%$ ) of $\mathbf{1 8}$ a were obtained as colorless crystals. M.p. $124.5-125.5^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl} 3$ ): $\boldsymbol{\delta} 2.29(\mathrm{~d}, J=2.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.41(\mathrm{~s}, 3 \mathrm{H})$, 3.76 (s, 3 H ), 5.17 (d, $J=8.6 \mathrm{~Hz}, 1 \mathrm{H}), 5.23$ (dd, $J=2.2,8.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.79(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 2$ H), 7.25 (d, $J=8.0 \mathrm{~Hz}, 2 \mathrm{H}$ ), 7.33 (d, $J=8.7 \mathrm{~Hz}, 2 \mathrm{H}$ ), 7.73 (d, $J=8.3 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 21.5\left(\mathrm{CH}_{3}\right), 48.4(\mathrm{CH}), 55.2\left(\mathrm{CH}_{3}\right), 74.5(\mathrm{CH}), 80.6\left(\mathrm{C}_{\text {quat. }}\right)$, $113.9(\mathrm{CH})$, $127.4(\mathrm{CH}), 128.4(\mathrm{CH}), 129.1\left(\mathrm{C}_{\text {quat. }}\right)$, $129.4(\mathrm{CH}), 137.3\left(\mathrm{C}_{\text {quat. }}\right), 143.4\left(\mathrm{C}_{\text {quat. }}\right), 159.6\left(\mathrm{C}_{\text {quat. }}\right)$. MS (70 eV, EI): m/z (\%): $315\left(\mathrm{M}^{+}, 2\right), 159\left(\mathrm{M}^{+}-\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{SO}_{2}-\mathrm{H}, 100\right), 145\left(\mathrm{M}^{+}-\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{SO}_{2}\right.$ - NH, 45), $91\left(\mathrm{C}_{7} \mathrm{H}_{7}, 13\right)$.

## 4-Methyl-N-(1-(4-phenoxyphenyl)prop-2-ynyl)benzenesulfonamide (18b)

According to the GP from the reaction of 12.1 g ( 34.5 mmols ) of $N$-(4-phenoxybenzylidene)-4-methylbenzenesulfonamide ( $\mathbf{1 6 b}$ ) and $102 \mathrm{ml}(52 \mathrm{mmols})$ of a 0.5 M solution of ethynyl magnesium bromide in 45 ml of THF, $10.7 \mathrm{~g}(82 \%)$ of $\mathbf{1 8 b}$ were obtained as colorless crystals. M.p. $96-97{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}, 300 \mathrm{MHz}$ ): $\delta 2.31(\mathrm{~d}, J=0.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.41$ (s, $3 \mathrm{H}, \mathrm{CH}_{3}$ ), 5.27 ( $\left.\mathrm{s}, 2 \mathrm{H}, \mathrm{NH}, \mathrm{CH}\right), 6.90(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 2 \mathrm{H}), 6.97(\mathrm{dd}, J=8.7 \mathrm{~Hz}, J=0.8 \mathrm{~Hz}, 2$ H), $7.11(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.26(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.31(\mathrm{dd}, J=8.0, J=0.8 \mathrm{~Hz}, 2 \mathrm{H})$, $7.35-7.40(\mathrm{~m}, 2 \mathrm{H}), 7.75(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right): \delta 21.49\left(\mathrm{CH}_{3}\right)$, $48.38(\mathrm{CH}), 74.68(\mathrm{CH}), 80.41\left(\mathrm{C}_{\text {quat. }}\right)$, $118.57(\mathrm{CH}), 119.06(\mathrm{CH}), 123.57(\mathrm{CH}), 127.38(\mathrm{CH})$, $128.69(\mathrm{CH}), 129.43(\mathrm{CH}), 129.76(\mathrm{CH}), 131.61\left(\mathrm{C}_{\text {quat. }}\right), 137.23\left(\mathrm{C}_{\text {quat. }}\right), 143.52\left(\mathrm{C}_{\text {quat. }}\right)$, 156,63 ( $\mathrm{C}_{\text {quat. }}$ ), $157.48\left(\mathrm{C}_{\text {quat. }}\right) . \mathrm{MS}(70 \mathrm{eV}, \mathrm{EI}): m / z(\%): 377\left(\mathrm{M}^{+}, 2\right), 222\left(\mathrm{M}^{+}-\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{SO}_{2}\right.$, 80), $207\left(\mathrm{M}^{+}-\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{SO}_{2}-\mathrm{NH}, 28\right), 155\left(\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{SO}_{2}, 7\right), 91\left(\mathrm{C}_{7} \mathrm{H}_{7}, 44\right)$.

### 6.6 General Procedure for the Enimine 19 Synthesis

A magnetically stirred solution of 1.0 mmol of (het)arylhalide $1,1.05 \mathrm{mmols}$ of propargyl $N$-tosyl amine $18,14 \mathrm{mg}(0.02 \mathrm{mmols})$ of $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right) \mathrm{Cl}_{2}$, and $2 \mathrm{mg}(0.01 \mathrm{mmols})$ of CuI in 4 mL of degassed triethylamine and 5 mL of THF under nitrogen was heated to reflux temperature for $24-48 \mathrm{~h}$. After cooling to room temperature 30 mL of diethyl ether was added to the reaction mixture. After filtration the solvents were removed in vacuo and the residue was washed with ethanol to give the enimines 19. Further purification could be achieved by recrystallization from ethanol or trituration with ethanol.

## $N$-[3-(4-Cyanophenyl)-1-(4-methoxyphenyl)-allylidene]-4-methyl-benzenesulfonamide

 (19a)

According to the GP the reaction of $182 \mathrm{mg}(1.00 \mathrm{mmol})$ of 4-bromobenzonitrile ( $\mathbf{1 a}$ ) and 331 mg ( 1.05 mmols ) of $\mathbf{1 8 a}$ furnished, after recrystallization from ethanol, $375 \mathrm{mg}(90 \%)$ of $\mathbf{1 9 a}$ as light yellow crystals. M.p. $129-132{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\boldsymbol{\delta} 2.42(\mathrm{~s}, 3 \mathrm{H}), 3.87$ ( $\mathrm{s}, 3 \mathrm{H}$ ), $6.94(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.04(\mathrm{~d}, J=16.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.32(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.71$ (d, $J=8.6 \mathrm{~Hz}, 2 \mathrm{H}$ ), 7.72 (d, $J=8.7 \mathrm{~Hz}, 2 \mathrm{H}$ ), $7.90(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 8.03(\mathrm{~d}, J=16.1 \mathrm{~Hz}$, $1 \mathrm{H}), 8.24(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 21.5\left(\mathrm{CH}_{3}\right), 55.5\left(\mathrm{CH}_{3}\right), 114.0$ $(\mathrm{CH}), 124.1(\mathrm{CH}), 127.1(\mathrm{CH}), 128.8(\mathrm{CH}), 129.4(\mathrm{CH}), 130.9\left(\mathrm{C}_{\text {quat. }}\right)$, $132.5(\mathrm{CH}), 138.5$ $\left(\mathrm{C}_{\text {quat. }}\right), 140.8\left(\mathrm{C}_{\text {quat. }}\right), 142.4(\mathrm{CH}), 143.6\left(\mathrm{C}_{\text {quat. }}\right), 148.5\left(\mathrm{C}_{\text {quat. }}\right), 163.7\left(\mathrm{C}_{\text {quat. }}\right), 175.2\left(\mathrm{C}_{\text {quat. }}\right)$. MS (70 eV, EI): m/z (\%): $416\left(\mathrm{M}^{+}+2 \mathrm{H}, 2\right), 261\left(\mathrm{M}^{+}-\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{SO}_{2}, 100\right), 247\left(\mathrm{M}^{+}-\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{SO}_{2}-\right.$ $\mathrm{NH}, 12), 155\left(\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{SO}_{2}, 6\right), 91\left(\mathrm{C}_{7} \mathrm{H}_{7}, 20\right)$.
$N$-[1-(4-Methoxy-phenyl)-3-pyrimidin-2-yl-allylidene]-4-methyl-benzenesulfonamide (19b)

### 6.7 General Procedure for the One-Pot Synthesis of 2-Ethoxy-6-panisylpyridines 21

A magnetically stirred solution of 1.00 mmol of (het)arylhalide $1,1.05 \mathrm{mmols}$ of propargyl $N$-tosyl amine 18, $14 \mathrm{mg}(0.02 \mathrm{mmols})$ of $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right) \mathrm{Cl}_{2}$, and $2 \mathrm{mg}(0.01 \mathrm{mmols})$ of CuI in 4 mL of degassed triethylamine and 5 mL of THF or toluene under nitrogen was heated to reflux temperature for $24-48 \mathrm{~h}$. After cooling to room temperature a solution of 4 mmols of diethyl ketene acetal in 5 mL of THF or acetonitrile were added and the reaction mixture was heated to reflux temperature for $24-48 \mathrm{~h}$. After cooling to room temperature 40 mL of ethyl
acetate and 40 mL of water were added and stirring was continued for 5 to 10 min . The aqueous layer was extracted with ethyl acetate $(4 \times 15 \mathrm{~mL})$ and the combined organic phases were dried with magnesium sulfate. After evaporation of the solvents in vacuo the residue was chromatographed on silica gel (hexane/ethyl acetate $4: 1$ or 1:1) and recrystallized from ethanol or pentane/chloroform (1:1) to give the analytically pure pyridine derivatives $\mathbf{2 1}$.

## 4-[2-Ethoxy-6-(4-methoxyphenyl)-pyridin-4-yl]-benzonitrile (21a)

According to the GP the reaction of $182 \mathrm{mg}(1.00 \mathrm{mmol})$ of 4-bromobenzonitrile (1a), 331 mg ( 1.05 mmols ) of $\mathbf{1 8 a}$, and $470 \mathrm{mg}(4.00 \mathrm{mmols})$ of diethyl ketene acetal in acetonitrile furnished, after chromatography on silica gel (hexane/ethyl acetate, 4:1) and recrystallization from ethanol, $188 \mathrm{mg}(57 \%)$ of 21a as yellow crystals. M.p. $97-98{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300\right.$ $\mathrm{MHz}): \delta 1.46(\mathrm{t}, J=7.3 \mathrm{~Hz}, 3 \mathrm{H}), 3.86(\mathrm{~s}, 3 \mathrm{H}), 4.53(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 6.77(\mathrm{~d}, J=1.1 \mathrm{~Hz}$, $1 \mathrm{H}), 6.98(\mathrm{~d}, J=8.9 \mathrm{~Hz}, 2 \mathrm{H}), 7.41(\mathrm{~d}, J=1.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.70-7.76(\mathrm{~m}, 4 \mathrm{H}), 8.02(\mathrm{~d}, J=8.8$ $\mathrm{Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right): \delta 14.7\left(\mathrm{CH}_{3}\right), 55.4\left(\mathrm{CH}_{3}, \mathrm{OMe}\right), 61.9\left(\mathrm{CH}_{2}\right.$, $\left.\mathrm{OCH}_{2} \mathrm{CH}_{3}\right)$, $106.5(\mathrm{CH}), 110.4(\mathrm{CH}), 112.5\left(\mathrm{C}_{\text {quat. }}\right)$, $114.1(\mathrm{CH}), 118.6\left(\mathrm{C}_{\text {quat. }}\right)$, $127.8(\mathrm{CH})$, $128.1(\mathrm{CH}), 131.4\left(\mathrm{C}_{\text {quat. }}\right), 132.7(\mathrm{CH}), 143.5\left(\mathrm{C}_{\text {quat. }}\right), 149.9\left(\mathrm{C}_{\text {quat. }}\right), 155.5\left(\mathrm{C}_{\text {quat. }}\right), 160.7$ $\left(\mathrm{C}_{\text {quat. }}\right), 164.2\left(\mathrm{C}_{\text {quat. }}\right)$. MS ( $70 \mathrm{eV}, \mathrm{EI}$ ): $m / z(\%): 330.1\left(\mathrm{M}^{+}, 43\right), 315\left(\mathrm{M}^{+}-\mathrm{CH}_{3}, 100\right), 302\left(\mathrm{M}^{+}\right.$ - $\mathrm{C}_{2} \mathrm{H}_{4}, 30$ ). IR (KBr): $\widetilde{v} 3065,2973,2227(\mathrm{C} \equiv \mathrm{N}), 1602,1545,1515,1425,1380,1342$, 1296, 1260, 1260, 1176, 1037, 830, 586, $516 \mathrm{~cm}^{-1}$. Anal. calcd. for $\mathrm{C}_{23} \mathrm{H}_{23} \mathrm{NO}_{4}$ (377.4): C 73.19, H 6.14, N 3.71; found C 73.18, H 6.09, N 3.82 .

### 6.8 General Procedure for the Coupling-Isomerization-Cycloaddition

 Sequence to Annelated 2-Amino Pyridines 27A magnetically stirred solution of 1.00 mmol of halogen compound $1,1.05 \mathrm{mmols}$ of propargyl tosyl amide $18,20 \mathrm{mg}(0.02 \mathrm{mmols})$ of $\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{PdCl}_{2}$, and $2 \mathrm{mg}(0.01 \mathrm{mmols})$ of CuI in 3.5 mL of degassed triethylamine and 5 mL THF under nitrogen was heated to reflux temperature for 24 h (for experimental details, see Table 28). After cooling to room temperature a solution of 5 mmols of $N, S$-ketene acetals 25 in 1 mL of THF were added and the reaction mixture was heated to reflux temperature for 12 h . After cooling to room temperature 40 mL of ethyl acetate and 40 mL of water were added and stirring was
continued for 5 to 10 min . The aqueous layer was extracted with ethyl acetate ( $4 \times 15 \mathrm{~mL}$ ) and the combined organic phases were dried with magnesium sulfate. After filtration the solvents were removed in vacuo and the residue was chromatographed on silica gel (hexane/ethyl acetate $4: 1$ or $1: 1$ ) and recrystallized from ethanol or pentane/chloroform (1:1) to give the analytically pure annelated 2-amino pyridine derivatives 27 .

Table 28 Experimental details for the synthesis of annelated 2-amino pyridines 27.

### 6.9 General Procedure for Synthesis of Enamine 30

A mixture of 50 mmols of 1,3-diketone 28, 50 mmols of amine 29, and catalytical amount of $p$-toluenesulfonic acid (PTSA), in 100 mL dry benzene, were refluxed for 16 hours, using the water trap, under inert atmosphere (nitrogen). The reaction mixture was added to 20 mL of diethyl ether, and after filtration and solvent evaporation the pure enamine was isolated. In same cases, the enamines were purified by distillation at low pressure.

## (Z)-4-(2-(1H-indol-3-yl)ethylamino)pent-3-en-2-one (30a) ${ }^{151}$

According to the GP, $170 \mathrm{mg}(70 \%)$ of $\mathbf{3 0 a}$ were isolated. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right), \boldsymbol{\delta}$ $1.83(\mathrm{~s}, 3 \mathrm{H}), 1.99(\mathrm{~s}, 3 \mathrm{H}), 3.03(\mathrm{t}, J=6.0 \mathrm{~Hz}, 2 \mathrm{H}), 3.51(\mathrm{q}, J=6.0 \mathrm{~Hz} 2 \mathrm{H}), 4.93(\mathrm{~s}, 1 \mathrm{H})$, 7.07-7.24 (m, 3 H ), 7.31 (d, $J=9.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.54(\mathrm{~d}, J=9.0 \mathrm{~Hz}, 1 \mathrm{H}), 8.75(\mathrm{~s}, 1 \mathrm{H}), 10.90$ $(\mathrm{s}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right), \delta 18.9\left(\mathrm{CH}_{3}\right), 26.0\left(\mathrm{CH}_{2}\right), 28.6\left(\mathrm{CH}_{3}\right), 43.4\left(\mathrm{CH}_{2}\right)$, $95.2(\mathrm{CH}), 111.5(\mathrm{CH}), 111.7\left(\mathrm{C}_{\text {quat. }}\right), 118.2(\mathrm{CH}), 119.1(\mathrm{CH}), 121.8(\mathrm{CH}), 123.0(\mathrm{CH}), 127.0$ $\left(\mathrm{C}_{\text {quat. }}\right)$, $136.5\left(\mathrm{C}_{\text {quat. }}\right), 163.2\left(\mathrm{C}_{\text {quat. }}\right), 194.6\left(\mathrm{C}_{\text {quat. }}\right)$. ### 6.10 General Procedure for the Coupling-Isomerization-Enamine Addition-Aldol-Condensation Multicomponent Synthesis of Cyclohexadienes 31 and Cyclohexenones 32

A magnetically stirred solution of 1.00 mmol of halogen compound $\mathbf{1}, 1.05 \mathrm{mmols}$ of propargyl alcohol $2,20 \mathrm{mg}(0.02 \mathrm{mmols})$ of $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right) \mathrm{Cl}_{2}$, and $2 \mathrm{mg}(0.01 \mathrm{mmols})$ of CuI in $\sim 0.5 \mathrm{~mL}$ ( 505 mg ) of degassed triethylamine and 1.5 mL THF under nitrogen, in a sealed vessel was heated to $150{ }^{\circ} \mathrm{C}$, for $10-15 \mathrm{~min}$, under microwave irradiation. After cooling to room temperature 3 mmols of enamine $\mathbf{3 0}$ and 0.75 mL of $\mathrm{CH}_{3} \mathrm{COOH}$ were added and the reaction mixture was heated to $150{ }^{\circ} \mathrm{C}$, for another $10-15 \mathrm{~min}$. After cooling to room temperature the reaction mixture was poured to 40 mL of ethyl acetate and 40 mL of water and stirring was continued for 5 to 10 min . The aqueous layer was extracted with ethyl acetate $(4 \times 15 \mathrm{~mL})$ and the combined organic phases were dried over magnesium sulfate. After filtration the solvents were removed in vacuo and the residue was chromatographed on silica gel (hexane/ethyl acetate $4: 1$ or $1: 1$ ) and recrystallized from ethanol or pentane/chloroform (1:1) to give the analytically pure cyclohexadienes $\mathbf{3 0} \mathbf{a}-\mathbf{k}$, or cyclohexanones $\mathbf{3 2} \mathbf{a}-\mathbf{i}$.

Table 29 Experimental details of the synthesis of cyclohexadienes $\mathbf{3 0}$ and cyclohexanones $\mathbf{3 2}$.

### 6.11 General Procedure for the Coupling-Isomerization/Coupling of o-Amino Aryl Halides 1 with Propargylic Alcohols 2

A magnetically stirred solution of 1.00 mmol of halogen compound $\mathbf{1}, 1.05 \mathrm{mmols}$ of propargyl alcohols 2, $20 \mathrm{mg}(0.02 \mathrm{mmols})$ of $\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{PdCl}_{2}$, and $2 \mathrm{mg}(0.01 \mathrm{mmols})$ of CuI in 2 mmols of degassed DBU and 1.5 mL THF under nitrogen was stirred under nitrogen in a heavy-walled SmithCreator process vial at the temperature and time indicated, (for experimental details see Table 30) in the microwave cavity. After cooling to room temperature 40 mL of ethyl acetate and 40 mL of water were added and stirring was continued for 5 to 10 min . The aqueous layer was extracted with ethyl acetate ( $4 \times 15 \mathrm{~mL}$ ) and the combined organic phases were dried over magnesium sulfate. After filtration the solvents were removed in vacuo and the residue was chromatographed on silica gel
(hexane/ethyl acetate $4: 1$ or 1:1) and recrystallized from ethanol or pentane/chloroform (1:1) to give the analytically pure alkyne $\mathbf{3 8}$ and respectively the quinoline 41.

Table 30 Experimental details of the synthesis of alkyne 38 and quinoline 40.

Table 51 Crystal Data and Structure Refinement for $N, N$-dimethyl-2-oxo-4-phenyl-6-(4-(trifluoromethyl)phenyl)cyclohex-3-enecarboxamide, 32d.

| Empirical Formula | $\mathrm{C}_{22} \mathrm{H}_{20} \mathrm{~F}_{3} \mathrm{NO}_{2}$ |
| :---: | :--- |
| Formula Weight | 387.39 |
| Temperature | $200(2) \mathrm{K}$ |
| Wavelength | $0.71073 \AA$ |
| Crystal system | Triclinic |
| Space group | $\mathrm{P}-1$ |
| Unit cell dimensions | $\mathrm{a}=10.7411(1) \AA \quad \alpha=99.400(1)^{\circ}$. |
|  | $\mathrm{b}=13.6656(2) \AA \quad \beta=103.720(1)^{\circ}$. |
| Volume | $\mathrm{c}=14.9311(3) \AA \quad \gamma=106.400(1)^{\circ}$. |
| Z | $1979.14(5) \AA^{3}$ |
| Density (calculated $)$ | 4 |
| Absorption coefficient | $1.300 \mathrm{~g} / \mathrm{cm}^{3}$ |
| Crystal size | $0.102 \mathrm{~mm}^{-1}$ |
| $\theta_{\text {min }} / \theta_{\text {max }}$ | $0.40 \times 0.24 \mathrm{x} 0.20 \mathrm{~mm}$ |
| Reflections collected | 1.45 to $23.26^{\circ}$. |
| Independent reflections | 14698 |
| Absorption correction | $5674[\mathrm{R}($ int $)=0.0246]$ |
| Refinement method | semi-empirical from equivalents |
| Data/restraints/parameters | Full-matrix least-squares on $\mathrm{F}^{2}$ |
| Goodness-of-fit on $\mathrm{F}^{2}$ | $5674 / 0 / 509$ |
| Final R indices $(\mathrm{I}>2 \sigma(\mathrm{I}))$ | 1.03 |
| $(\Delta \rho)_{\text {max }}$ und $(\Delta \rho)_{\text {min }}$ | $\mathrm{R}_{1}=0.043$ and $\mathrm{R} 2=0.1 .07$ |
|  | 0.38 and $-0.32 \mathrm{eA}^{-3}$ |

Table 52 Crystal Data and Structure Refinement for 6-(4-cyanophenyl)- $N, N$-dimethyl-2-oxo-4-(thiophen-2-yl)cyclohex-3-enecarboxamide, 32g.

| Empirical Formula | $\mathrm{C}_{20} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}$ |
| :---: | :---: |
| Formula Weight | 350.42 |
| Temperature | 100(2) K |
| Wavelength | 0.71073 Å |
| Crystal system | Triclinic |
| Space group | P-1 |
| Unit cell dimensions | $\mathrm{a}=9.925(2) \AA \quad \alpha=68.277(4){ }^{\circ}$. |
|  | $\mathrm{b}=10.178(2) \AA \quad \beta=67.477(4){ }^{\circ}$. |
|  | $\mathrm{c}=10.300(2) \AA \quad \gamma=68.712(4)^{\circ}$. |
| Volume | 862.7(3) $\AA^{3}$ |
| Z | 2 |
| Density (calculated) | $1.349 \mathrm{~g} / \mathrm{cm}^{3}$ |
| Absorption coefficient | $0.203 \mathrm{~mm}^{-1}$ |
| Crystal size | $0.33 \times 0.32 \times 0.20 \mathrm{~mm}$ |
| $\theta_{\text {min }} / \theta_{\text {max }}$ | 2.22 to $28.30^{\circ}$. |
| Reflections collected | 9081 |
| Independent reflections | $4232[\mathrm{R}(\mathrm{int})=0.0179]$ |
| Absorption correction | semi-empirical from equivalents |
| Refinement method | Full-matrix least-squares on $\mathrm{F}^{2}$ |
| Data/restraints/parameters | 4232/8/313 |
| Goodness-of-fit on $\mathrm{F}^{2}$ | 1.02 |
| Final R indices ( $\mathrm{I}>2 \sigma(\mathrm{I})$ ) | $\mathrm{R}_{1}=0.036$ and $\mathrm{R}_{2}=0.099$ |
| $(\Delta \rho)_{\text {max }}$ und $(\Delta \rho)_{\text {min }}$ | 0.35 and $-0.25 \mathrm{eA}^{-3}$ |

Table 53 Crystal Data and Structure Refinement for 2-phenylquinoline-6-carbonitrile, 40c.

| Empirical Formula | $\mathrm{C}_{16} \mathrm{H}_{10} \mathrm{~N}_{2}$ |
| :---: | :---: |
| Formula Weight | 230.26 |
| Temperature | 200(2) K |
| Wavelength | 0.71073 A |
| Crystal system | Triclinic |
| Space group | P-1 |
| Unit cell dimensions | $\mathrm{a}=3.8902(2) \AA \quad \alpha=111.558(1)^{\circ}$. |
|  | $\mathrm{b}=11.7293(7) \AA \quad \beta=92.791(1)^{\circ}$. |
|  | $\mathrm{c}=13.4790(8) \AA \quad \gamma=90.013{ }^{\circ}$. |
| Volume | 571.23(6) $\AA^{3}$ |
| Z | 2 |
| Density (calculated) | $1.339 \mathrm{~g} / \mathrm{cm}^{3}$ |
| Absorption coefficient | $0.080 \mathrm{~mm}^{-1}$ |
| Crystal size | $2.20 \times 0.24 \times 0.10 \mathrm{~mm}$ |
| $\theta_{\text {min }} / \theta_{\text {max }}$ | 1.63 to $27.48^{\circ}$. |
| Reflections collected | 5862 |
| Independent reflections | 2568 [ R (int) $=0.0231$ ] |
| Absorption correction | semi-empirical from equivalents |
| Refinement method | Full-matrix least-squares on $\mathrm{F}^{2}$ |
| Data/restraints/parameters | 2568/ 0 /203 |
| Goodness-of-fit on $\mathrm{F}^{2}$ | 1.03 |
| Final R indices ( $\mathrm{I}>2 \sigma(\mathrm{I})$ ) | $\mathrm{R}_{1}=0.039$ and $\mathrm{R}_{2}=0.109$ |
| $(\Delta \rho)_{\text {max }}$ und $(\Delta \rho)_{\text {min }}$ | 0.20 and $-0.23 \mathrm{eA}^{-3}$ |
